Stablecoins: Benefits & Use Cases

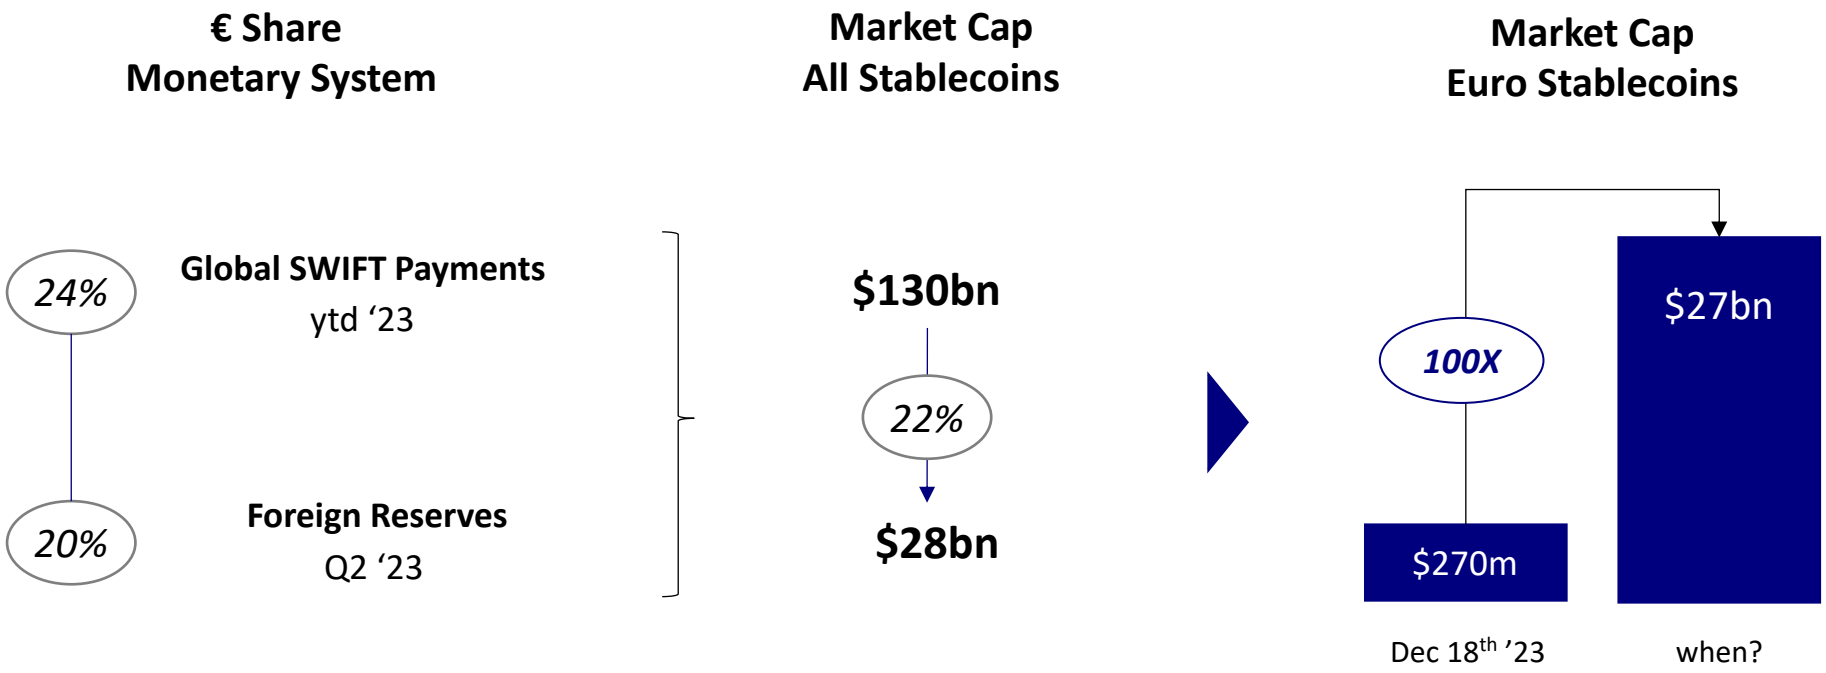

Why Euro Stablecoins?

MiCAR and More

Competitive Landscape

Euro Stablecoins: Key Success Factors

100X growth opportunity for Euro stablecoins if their market cap share reaches the Euro share in the fiat monetary system.

Sources: Market Cap data: coingecko Dec 18th 2023; Global SWIFT Payments: Statista & own calculations of unweighted averages per annum; Foreign Reserves: IMF

Why do we need Euro-denominated stablecoins? What are the benefits?

Diversification of Currency Risk: Having stablecoins pegged to the Euro allows users to diversify their currency risk and eliminates hedging costs for EU based digital asset traders and DeFi yield farmers.

Opening up of FX Markets: Euro stablecoins with significant liquidity will facilitate USD-Euro stablecoin trades and further open up foreign exchange markets with other fiat pegged stablecoins

Facilitation of Eurozone Transactions: For individuals and businesses in the Eurozone, a Euro-denominated stablecoin can speed up transactions - 24/7 settlement with no value limits

Settlement of EU Issued Digital Securities: Euro stablecoins allow instant settlement of EU issued bonds and in the future all types of tokenized equity.

Competition and Innovation: Increasing share of Euro-denominated stablecoins spurs innovation and competition in the stablecoin market, leading to improved services, lower fees, and better user experiences.

Economic Independence: Eurozone needs digital assets that are less influenced by the monetary policy and economic conditions of the United States.

Competitive Landscape

Euro Stablecoins: Key Success Factors

Stablecoins, CBDCs versus E-Money. Even if you hate definitions …

Stablecoin

blockchain-based and pegged to an asset for stability

A **blockchain-based digital currency** where the price is **stabilized against reference assets**.

These **assets** can include **fiat currencies**, other **cryptocurrencies**, **commodities** (like Gold), financial instruments or **baskets** thereof.

The **stability** is maintained through various mechanisms, like **holding reserves** in the pegged assets or **using algorithms**.

CBDC

digital fiat currency

Issued and regulated by a country's **central bank**; **legal tender**; not necessarily built on a blockchain, and if a private and centralized blockchain system; for the EU **Digital Euro caps for value in wallets** very likely

E-Money

digital representation of fiat money used in electronic payment systems

Primarily used through digital wallets, online banking, or payment systems; **regulated** and typically **backed one-to-one** with fiat currency; not necessarily built on blockchain technology, **relies on traditional banking infrastructure**

Stablecoins provide four key benefits compared to fiat money and volatile crypto assets.

Faster
almost immediate settlement

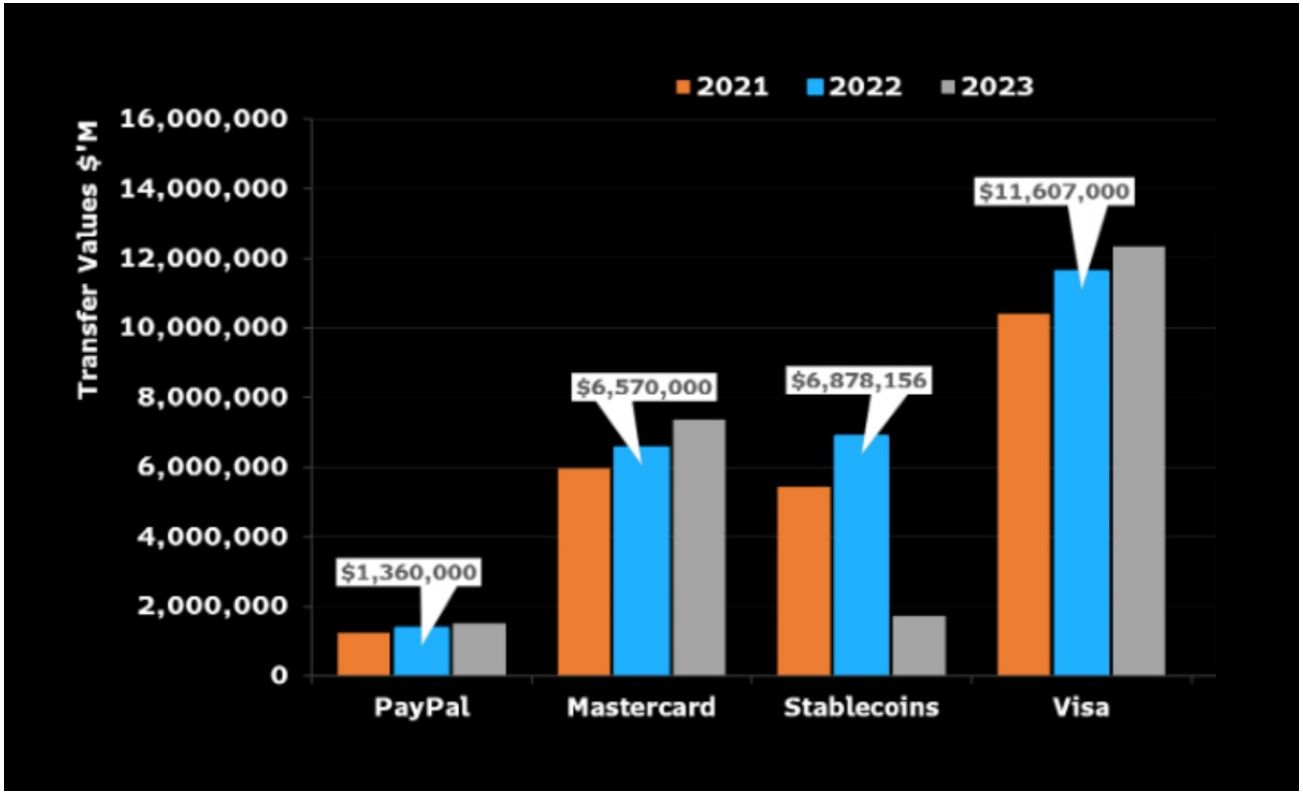

Stable
less volatile than other digital assets

Stablecoin Value Proposition

Lower Fees
less/no intermediaries

Programmable
conditional payments through smart contracts

Stablecoins shine out Mastercard and Paypal in transaction volume.

Sources: Bloomberg, Coinmetrics (2023)

Stablecoins have a broad range of use cases and can serve a variety of markets. The market potential is far from being fully exploited.

Payments

C2B payments

- E-commerce payments including in-game purchases
- POS merchant payments

P2P payments

- Friends & family, remittance, donations, …

B2B payments

- Salaries
- Vendors, suppliers
- Machine to machine

Store of Value

Fiat inflation hedge

- in countries with high inflation of local currencies (Venezuela, Argentina, Nigeria, Lebanon, Turkey …)

Crypto volatility hedge

- Temporary store of value in times of high volatility and/or bearish crypto markets

Treasuries

- i.e. for Decentralized Autonomous Organizations

Crypto Trading

- Fiat on- and off-ramp
- Collateral for derivatives
- FX trading

DeFi

- Lending, staking, liquidity supply for DEXes

Securitization

- Near instant settlement of tokenized bonds and equity

Main use cases for stablecoins at the moment (2023)

EU countries take a > 20% share in crypto transaction value received on-chain.

Sources: Chainanalysis (2023): The 2023 Geography of Cryptocurrency Report; EU countries share: own calculation based on Chainanalysis data
Central, Northern & Western Europe: incl. non EU countries such as UK, Switzerland, Norway, Ireland; Eastern Europe: incl. non EU countries such as Russia, Ukraine, Belarus …

100X growth opportunity for Euro stablecoins if their market cap share reaches the Euro share in the fiat monetary system.

Sources: Market Cap data: coingecko Dec 18th 2023; Global SWIFT Payments: Statista & own calculations of unweighted averages per annum; Foreign Reserves: IMF

Why hasn't the opportunity materialized so far and what does the future hold for Euro stablecoins?

BARRIERS	DOOR OPENERS
Challenging business model until '22 due to negative/zero base interest rates	New financial market environment **with base rates** for deposits at ECB raised **to >4%**
First mover advantage of USD-based products in financial markets	**Increasing global crypto transaction volume** and market cap will result in **regional differentiation of products** and additional local liquidity – same playbook as in traditional finance markets (equity and bonds) expected
Products not attractive enough: higher trading/exchange costs due to low liquidity	
For EU based crypto traders and investors **FX risk small** compared to digital asset volatility; **FX-sensitive payments little adoption yet**	Over a longer term the **volatility of crypto assets decreases** (see BTC); for future payment and **FX trading** use cases: **Euro coins are key**
Lack of regulatory clarity prior to MiCAR, major concern for risk averse European customers and users, in particular institutions and corporates	**MiCA regulation enters into force in 07/2024** providing regulatory clarity in particular wrt to stablecoins; limits use of USD based stablecoins

TABLE OF CONTENTS

The Opportunity in a Nutshell

Stablecoins: Benefits & Use Cases

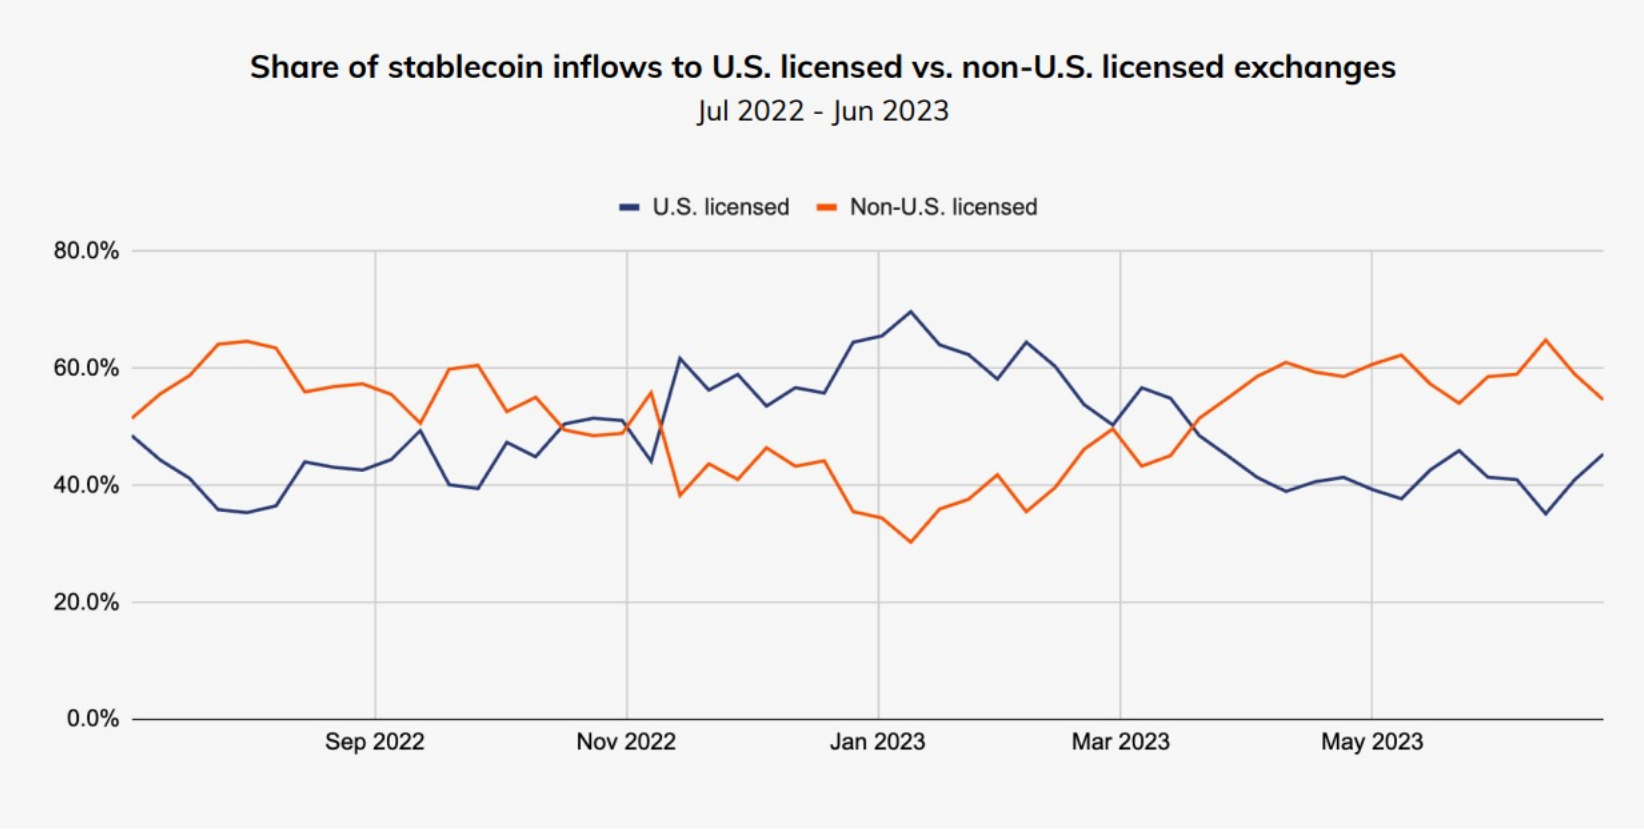

Why Euro Stablecoins?

MiCAR and More

Competitive Landscape

Euro Stablecoins: Key Success Factors

The U.S. may be losing regulatory oversight of the stablecoin market. Will EU's Market in Crypto Asset Regulation – MICAR- fill the void?

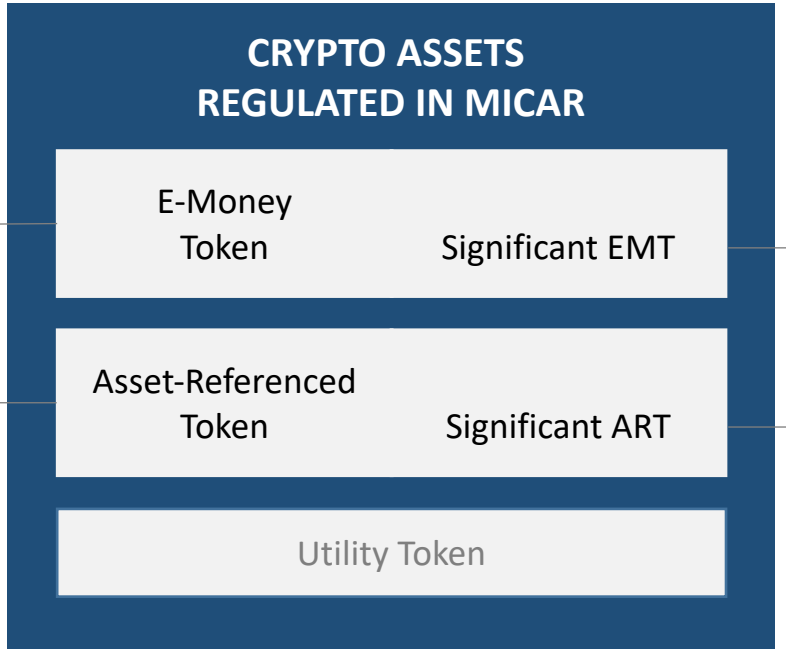

Source: Chainanalysis (2023): The 2023 Geography of Cryptocurrency Report: Stablecoin inflows to the 50 biggest crypto services

In MiCAR, compliant stablecoins are either E-Money Tokens or Asset Reference Tokens, and both types of tokens may be deemed significant.

EMT: Stablecoin referencing the value of a single fiat currency

ART: Non-EMT stablecoin referencing the value of commodities (i.e. gold), baskets of several currencies, crypto assets and any other value or right and combination thereof

Significant: Subject to higher capital requirements, to interoperability requirements and need to establish a liquidity management policy

USD stablecoins used as a means of exchange in the EU must comply with strict rules, i.e. a supply cap

Algorithmic stablecoins are banned

When is a token considered significant under MiCAR?

EMT / ART

Significance Criteria

at least 3 out of 7 criteria need to be met

- >10m holders
- Market capitalization, reserves or value issued >€5bn
- On daily average >2,5m transactions and >€500m transaction value
- International significance of activities
- Interconnectedness with financial system
- At least one additional ART or EMT issued and one crypto-asset service provided
- Provider of core platform services

Significant EMT / ART

Candidates:

USDT

USDC

Source: https://data.consilium.europa.eu/doc/document/PE-54-2022-INIT/en/pdf

Significant EMTs are subject to higher capital, risk management and liquidity management requirements.

NON COMPREHENSIVE

EMT Requirements

- **Legal entity in the EU** that issues tokens
- Issuer: **credit institute or electronic money institution** (EMI)
- Timely **notified and published whitepaper** with content as defined by the MiCAR regulation
- E-money tokens issued at par and **redeemable at par value any time** at no cost for the holders
- E-Money tokens shall **not grant interest**
- Own fund requirements and reserve:

  at least the highest of **€350k initial capital, 2% of** outstanding **reserves,** 25% of fixed overheads preceding year

  ≥30% of funds deposited in separate accounts in credit institutions

  remaining funds **invested** in highly liquid, **low risk assets** denominated in the e-money token reference currency
- **Recovery and redemption plans** for use if unable to meet obligations
- Supervised by **national regulator** (competent authority)

+

Significant EMT: Requirements for EMI

- **Reserve** of assets **legally and operationally segregated** from the issuers' estate & from the reserve of assets of other tokens
- Independent **audit** of reserve **every 6 six months**
- Reserves to be held in custody by a **qualified custodian***
- Need to **diversify reserve assets** by issuers and custodians safekeeping the assets
- Meet **liquidity requirements** by type of reserve asset as defined by EBA and establish a liquidity management policy
- Regular **stress tests**: Liquidity, interest rate shocks, operational risk, non-financial risks
- Own fund requirements and reserve:

  3% of the average amount **of the reserve assets**

  ≥ 60% of funds deposited in credit institutions

  In case of **higher** degree of **risks** associated with the token up to **20% higher** average **reserves**, depending on **stress test** outcome **20% to 40% higher** fund requirements
- Additionally supervised by **European Banking Authority**

** Qualified custodian: A credit institute for all types of assets, a crypto asset service provider for crypto assets, or specialized investment firms for financial instruments*

Asset referenced tokens have to meet higher standards than EMTs, however issuers do not need to be authorized EMIs or credit institutions.

NON COMPREHENSIVE

ART Requirements

- Entity needs to be **incorporated in the EU**
- **White paper** needs **prior approval by national regulator** (except for credit institutions)
- **Own fund** requirements similar to EMTs:
  at least the highest of **€350k**, **2%** of average **reserves** and **25% of fixed overheads** of preceding year
- EBA specified **liquidity requirements by type of reserve assets** and of the asset-referenced token itself
- A clear and detailed **policy** describing the **stabilization mechanism** of the token
- **Redemption at any time** upon request of the holders at market value of the referenced assets or by delivering the referenced assets; redemption **not subject to a fee**.
- **Similar requirements as for significant EMTs** regarding reserve mgt., custody, risk management and governance

Significant ART Requirements

- **Own fund** requirements:
  at least the highest of €350k, **3% of average reserves** and 25% of fixed overheads of preceding year
- **Supervised by EBA**

Candidates:

It's hard to imagine that the ART rules allow to operate an economically feasible business for stablecoins like DAI, Tether Gold and PAX Gold

The technical standards recently published by the EBA for consultation further specify liquidity requirements and policies.

Maturities of Reserve Assets by Market Value

Maximum Termination Period	Token not significant*	Significant Token	
▪ Up to 1 working day	≥ 20%	≥ 40%	for Tokens referencing to official currencies (Euro, USD, …)
▪ Up to 5 working days	≥ 30%	≥ 60%	

NON COMPREHENSIVE

Deposits with Credit Institutions

Deposits only with credit institutions for which there shall be **no reason to expect non-performance****

Per **large** (other) **credit institute not more than 10%** (5%) of the market value **of the reserve**

Token issuer deposits **not more than 2,5% of total assets of credit institute** (CI)

Deposit value + value of highly liquid financial instruments issued/guaranteed by CI or entities the CI has close links to: **≤ 25% market value of the reserve**

Highly Liquid Financial Instruments in the Reserve

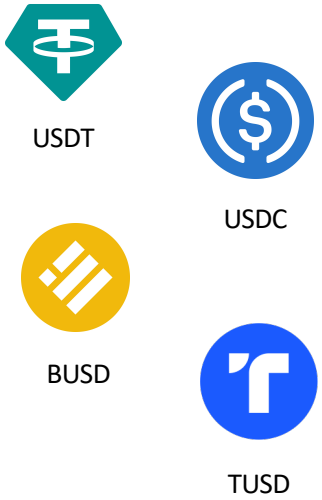

issued/guaranteed by a single entity or by entities with close links	% Market value of the reserve
▪ **Securities or money market instruments** not subject to any haircut	≤ 35%
▪ Extremely high quality **covered bonds**	≤ 10%
▪ **Other securities, money market instruments** or **crypto assets** that qualify as financial instruments	≤ 5%

Diversification limits concentration risks

**Asset Referencing Tokens and where decided by regulators E-Money Tokens ** as of Article 32(1) of the Liquidity Coverage Ratio Delegation Regulation*
Further liquidity standards specified by EBA include for example the mandatory overcollateralization of the reserve with a ratio determined by last 5 years' de-pegging history

MiCAR sets a cap for the supply of USD stablecoins used for payments in the EU.

EMTs denominated in non EU Member State Currency

Token Use Cases*

Means of exchange:

Transactions for payment purposes in the EU – including real-world payments

Means of investment

Transactions for trading or investment purposes: exchange of funds

MICAR Caps & Rules

- If **quarterly average number of txs >1m and average aggregate value of txs >€200m** per day as a ***means of exchange*** in the EU area:

  => **Stop issuing** the token

- If token poses a **threat to smooth operations** of payment system, monetary policy transmission or sovereignty:

  => **Limit the amount to be issued**

- If issue **value >€100m**:

  => Quarterly **reporting requirements,** i.e. regarding number of holders, average number and value of transactions

** Definition and measurement are currently further specified by the EBA - ongoing consultation process*

In a nutshell: MICAR opens up the stablecoin market for traditional financial institutions while setting the bar high for fintech start ups.

Regulatory clarity for stablecoin issuers

One rulebook for the whole of EU instead of 27 different licenses and supervisors to deal with

Builds a **bridge for TradFi** to enter the market

MICAR

Strict requirements and rules set **high barriers for start-ups**/fintechs

Caps on USD stablecoins and ban of algorithmic stablecoins **restrict product access for EU citizens**: higher costs / need to go offshore

Oversees enforcement unclear

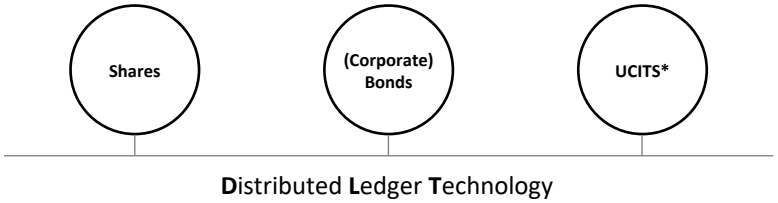

Compliant Euro denominated stablecoins benefit whereas unregulated offshore companies will no longer be able to target EU consumers pro-actively

Besides MiCAR, the EU DLT pilot regime and the reform of the Payment Services Regulation might play out in favor of Euro stablecoins.

DLT PILOT REGIME

The DLT Pilot Regime is a regulatory sandbox.

It applies to DLT financial instruments, i.e. stocks, bonds and fund units that are issued, recorded, transferred and stored using DLT.

The DLT pilot regime allows capital markets trading & settlement of tokenized securities through stablecoins (e-money tokens).

DLT Pilot regime entered into force on 23 March 2023.

PAYMENT SERVICES REGULATION

Patrick Hansen 
@paddi_hansen 19. Sep. 2023

In the context of the upcoming review of EU payments rules (PSD/PSD3), some key changes are coming to the EU payments sector. EU Commission head of unit (retail & payments) Ducoulombier:

"We propose to modify the Settlement Finality Directive (SFD) to enable **non-banks to access payment systems**. We also propose **remedies to the recurring 'de-risking' problem** faced by some Payment Institutions (PIs) and E-money Institutions (EMIs), which should substantially improve their capacity to open and maintain bank accounts."

Meaning stablecoin (EMT) issuers will be able to access central bank payment systems, safeguard funds with the central bank, and should have less trouble opening bank accounts. Good development for innovation and competition in payments in the EU.

Majority of amendments to the Payment Services Directives and Regulation are expected to take effect in 2026 earliest.

** Units in Collective Investment Undertakings*

The future competitive landscape will be characterized by fewer featherweights, but more heavy weights.

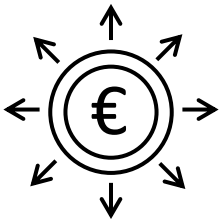

Consolidation of existing player landscape

- Atm **too many small players** for a niche market, projects are at risk of running out of money
- **MiCAR** sets the future **barriers high for compliance**, even if the stablecoin is not significant in regulatory terms
- **Significant upfront funding is needed** to launch a new coin, not only due to compliance with regulatory requirements but also to **establish networks within both the crypto and real-world environments**. These networks are essential for serving multiple use cases and market segments

e-Money Stablecoin Unwind

e-Money A/S has decided to cease issuance of its EEUR, ECHF, ENOK, ESEK & EDKK stablecoins

Published in e-Money.com · 4 min read · Jan 9

Market expansion through heavy weights

- Large, **regulated institutional finance players**, in particular banks, **comply with MiCAR standards**, and are able to serve a broad range of use cases ranging from payments and FX to securitization of bonds and equity
- **Leading euro stablecoins** and fintechs with strategically relevant investors will **benefit from VC/PE money concentration** on a select few
- As the market volume reaches a certain threshold, it becomes lucrative for **blue chip players** in the **payment space** to introduce with their **products**
- New use cases, i.e. **M2M payments**, will **attract companies from other industries** such as automotive and manufacturing, of which some may consider launching their **own stablecoin,** standalone or - more likely - through partnerships with Web3 or traditional finance players.

STATUS QUO 2023

L: Category lead in terms of capabilities

Selected strengths and weaknesses of the different future player groups in the Euro stablecoin market. There's no pre-set winner in this game.

	Strengths / Capabilities	Weaknesses / Limitations
Incumbent Stablecoins & Web3 Fintechs	Fast, agile movers with Web3 experience, networks and customer base Operational experience	! Few(er) real world partnerships ! Need to apply for EMI license and to ramp up compliance capabilities
Commercial Banks	Trusted brands with up- and running compliance and risk management Real world partner base	! Limited acceptance of product by other commercial banks ! Limited web3 experience (banks & customers)
Bank Consortia	Buy-in from a broad range of banking players Significant customer base	! Massive co-ordination and governance efforts ! Limited web3 / crypto experience
Neo Banks & Brokers	Fast and agile, and already compliant Leading players with crypto trading offerings	! No/very little DeFi know-how ! Missing institutional network for tokenization
Payment Providers	Strong networks to serve payment use cases Typically more agile than banks	! Typically no experience in DeFi ! Missing institutional network for tokenization
Other Industry Players	Comparatively advanced in machine to machine use cases Strong branding & industry networks	! Likely a blue ocean project which might be hard to fund and keep up internally ! Limited footprint in finance, payments & web3

TABLE OF CONTENTS

The Opportunity in a Nutshell

Stablecoins: Benefits & Use Cases

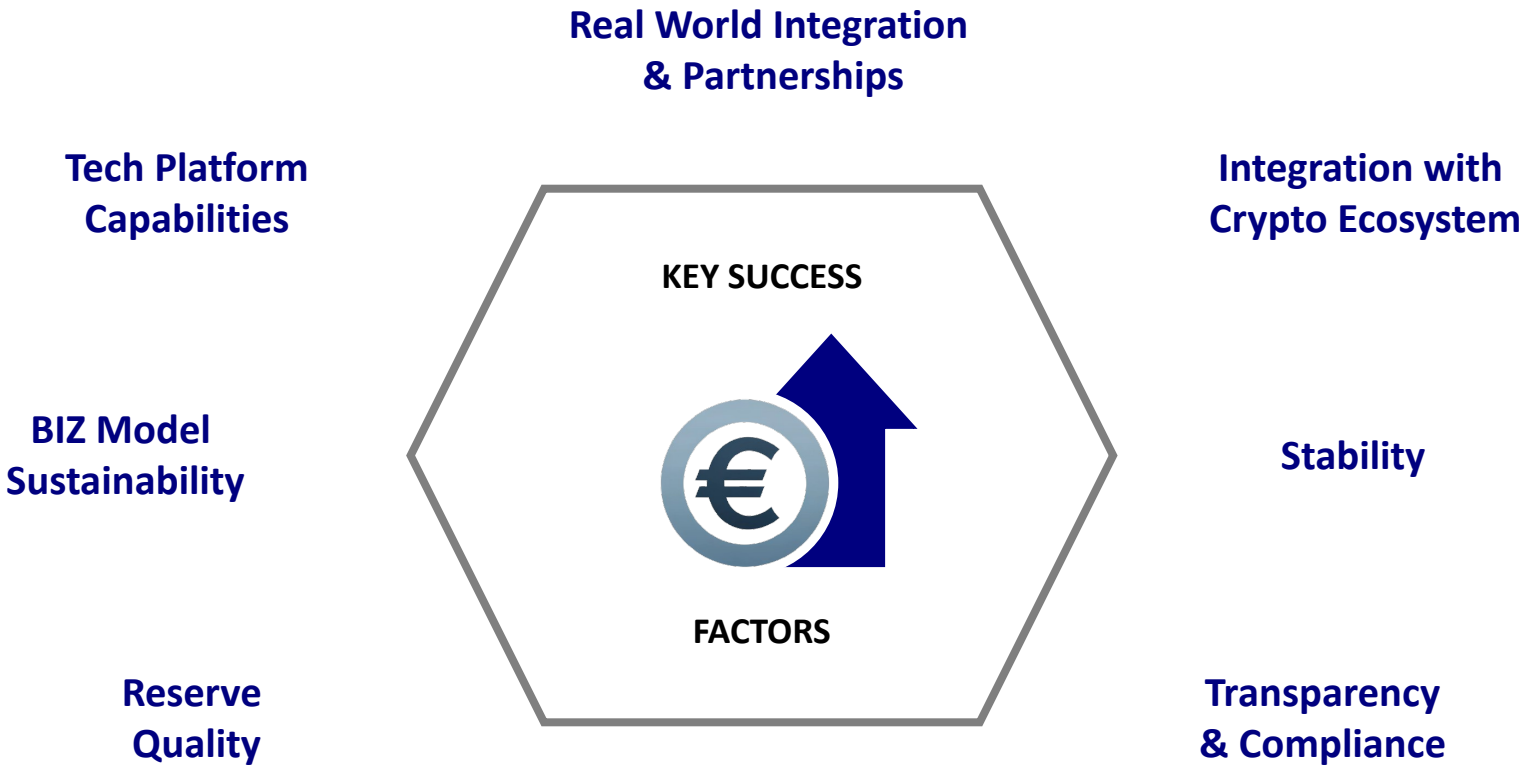

Why Euro Stablecoins?

MiCAR and More

Competitive Landscape

Euro Stablecoins: Key Success Factors

Launching and running a stablecoin business is a complex undertaking. Here are key success factors.

Breaking down the drivers of success for a regulatory compliant stablecoin business.

Tech Platform Capabilities

Platform for minting and redemption of stablecoins differentiates through:

- Convenient, efficient, fully automated/digital use
- Cost of onboarding minimal for customers
- Suited for retail (individual) and institutional customers
- Reliable counterparties (banks)
- Access to SEPA and SWIFT
- Narrow banking: Central bank accounts

Real World Integration & Partnerships

- With payment service providers (Visa, Mastercard, Paypal, …)
- With banks/financial institutions for on- and off-ramp, securitization
- With industry partners, i.e. for B2B payments or B2B2C business models

Stability

- Consistently mirroring the benchmark currency with minimum deviation
- Fast recovery after de-peg events

Integration with Crypto Ecosystem

- CEX listings - the higher the CEX reach the better
- Routing through popular DeFi aggregators like 1Inch, Paraswap etc.
- Contribution to liquidity pools of leading protocols, i.e. DEXes like Curve
- Integration with popular wallets
- Presence on most frequently used L1 and L2 blockchains
- Strong presence in crypto social media & active community (X, YT, discord, tg, …)

BIZ Model Sustainability

- Sustainable revenue streams from interest income, service fees and investments
- Stress tested against changes in the macro environment, i.e. Central Bank interest rate policy

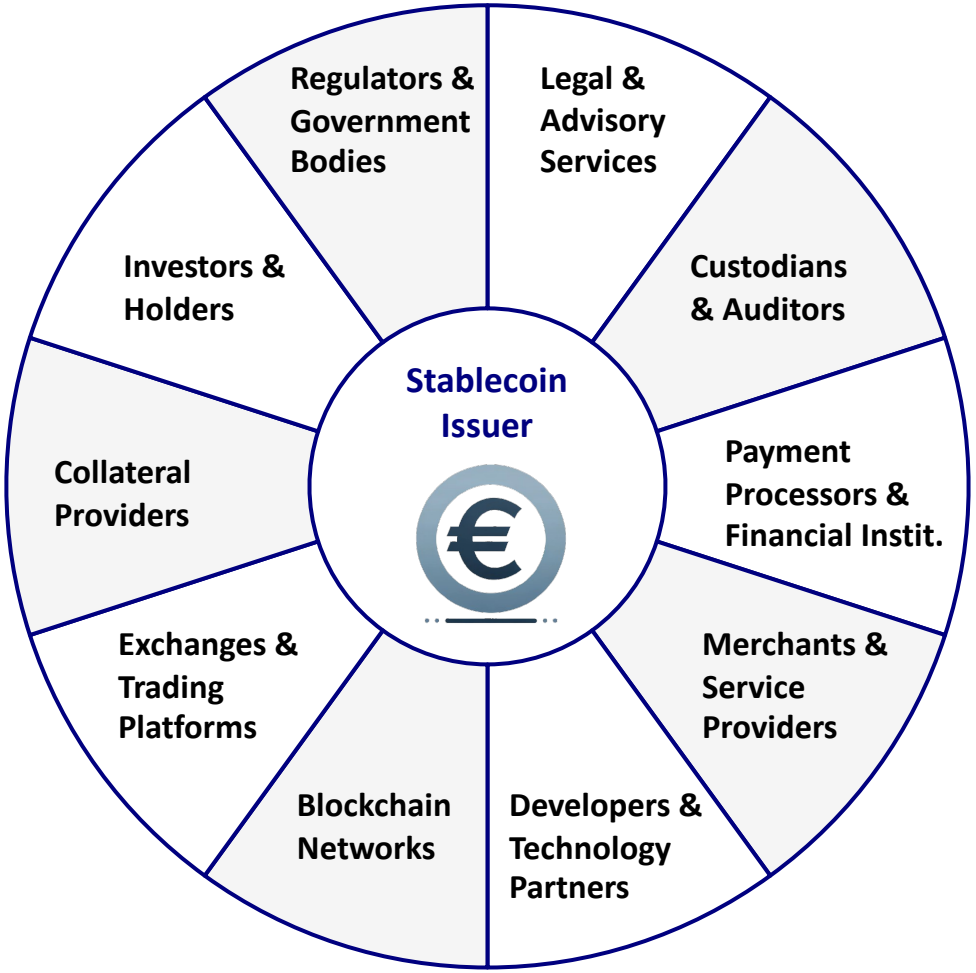

Reserve Quality

- 1:1 backed with fiat money or overcollateralized with volatile assets
- High share of cash or cash equivalents
- Short-term bonds with top ratings
- Reserves deposited at Central Banks or large system relevant banks, diversified

Transparency & Compliance

- Compliant with regulation (i.e. MiCAR)
- Regular 3rd party attested reserve reports and audits
- Regulatory audits (i.e. AML and tech)
- Financial statements public

Multiple parties contribute to the stablecoin's ecosystem, ensuring its functionality, legal compliance, market stability, and user trust.

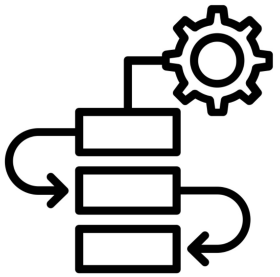

Stablecoins are not single isolated products but platforms operating in complex eco-systems.

Efficiently managing the ecosystem partners determines the overall health and success of the stablecoin.

What it takes to operate an asset backed regulatory compliant stablecoin from a functional perspective.

STABLECOIN OPERATING MODEL

- Key Functions -

Issuance and Redemption
Robust systems and processes for transaction processing and verification, i.e. fiat money on- and off-ramping.

Regulatory Compliance
Ensuring compliance with laws, acquiring necessary licenses, and implementing anti-money laundering (AML) and know your customer (KYC) procedures.

Reserve & Price Stability Management
Auditing the reserves, ensuring liquidity, and handling the logistics of collateral storage and protection. Implementing and managing mechanisms to maintain the peg to the underlying asset.

Security and Infrastructure Maintenance
Monitoring the security of the underlying blockchain networks, protecting against cyber threats, and regular maintenance of the technical infrastructure.

Partnerships and Integration
Integrating the stablecoin into various exchanges, wallets, and payment systems. Managing partnerships with financial institutions, crypto exchanges, and other service providers.

Marketing and Community Engagement
Promoting the stablecoin, building a community of users and developers, and maintaining transparent communication channels for trust building.

Development & Innovation
Continuously improving features, security, and usability, and adapting to changing market conditions or technological advancements.

Customer Support
Providing support for users, addressing technical issues, and handling disputes or queries.

Financial Monitoring & Risk Management
Regularly financial monitoring, preparing financial and compliance reports, and supporting financial audits. Managing credit and interest rare risks.

Succeeding in the Euro stablecoin market is not a walk in the park.

Huge opportunities require great efforts, and the right go to market strategy.
