## Executive Summary

The metaverse, a virtual universe of interconnected digital worlds, is redefining brand experiences and consumer engagement. With its growing popularity, it is poised to become an essential platform for brands to create immersive and interactive experiences. This report provides a comprehensive understanding of the metaverse and outlines a strategic approach to leveraging its potential for brands.

Part 1 defines the metaverse, its impact on brand experiences, and consumer behavior within these virtual environments. It delves into the technical aspects of the metaverse and showcases case studies, including LandVault's work during the Metaverse Fashion Week 2022 and Hershey.

In Part 2, we focus on creating metaverse experiences for brands. We will discuss the importance of defining objectives and KPIs, and highlight the key elements of metaverse experience design, content creation, and community management.

Part 3 outlines launching and marketing a metaverse experience, touching on pre-launch preparations, marketing strategies, and measuring success and ROI. Our successful campaigns with Mastercard and SC Ventures demonstrate how to execute and optimize metaverse experiences.

Finally, Part 4 addresses challenges and opportunities in the metaverse. It offers practical solutions to overcome common obstacles, such as inadequate understanding of the medium, insufficient planning, and data privacy concerns. The report also presents predictions for the future of the metaverse and potential opportunities for brands.

In an ever-evolving digital world, brands that adapt and embrace the metaverse stand to gain a competitive edge, build stronger connections with their audience, and unlock new revenue streams. With LandVault's guidance and support, brands can navigate the complexities of the metaverse, create meaningful experiences, and drive lasting impact in this new frontier of digital engagement.

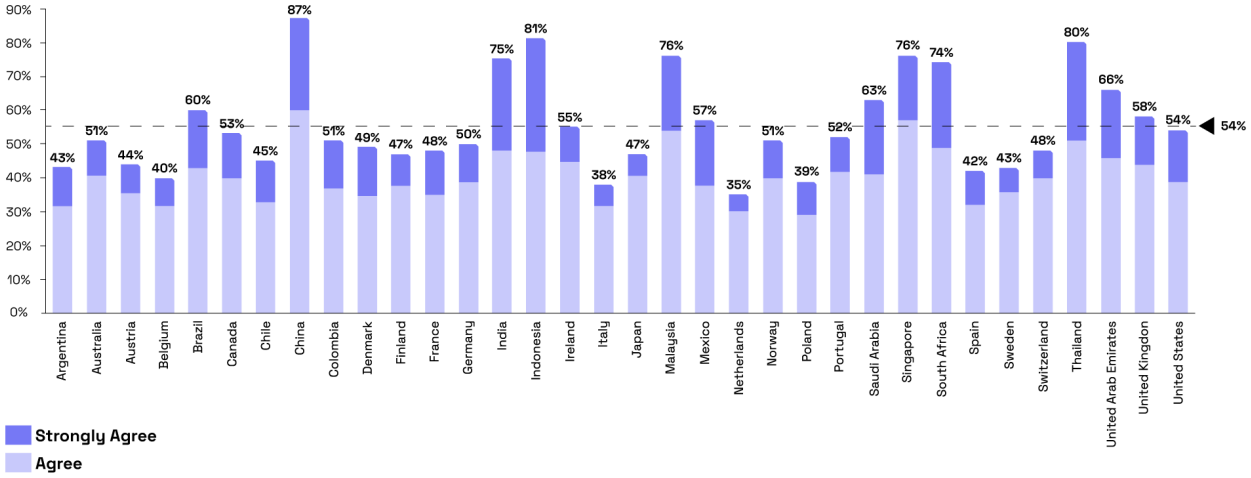

# Introduction

Since the widespread adoption of the internet in the 1990s, cyberspace has continued to develop and advance. The landscape evolved from Internet of Data in the 2000s, to Internet of People and Internet of Things in the 2010s. Today we're at the cusp of the next major evolution with the Internet of Place and Internet of Ownership driven by Web3 technologies and the creation of the metaverse. These emerging technologies are geared toward providing more persistent shared experiences compared to 15 years ago when technology's main aim was mass participation.

## Globally, 54% of consumers agree “More and more of my life and livelihood is moving into digital spaces.”

Q. To what extent do you agree or disagree with the following statement? Top Two (Agree + Strongly agree) More and more of my life and livelihood is moving into digital spaces.

Source: Accenture Technology Vision 2022 Global Consumer Survey. N=23,500

Consumers’ lives are moving to digital spaces

The ultimate vision is ‘the metaverse’ - a gradual convergence of the physical world with the digital world, where items and personas can be unique and are not subject to the constraints and limitations of reality.

A look at the changing landscape of the internet emphasizes the rise of the metaverse. But what is the metaverse? Though there is no agreed-upon definition until now, tech futurist and metaverse expert Cathy Hackl claims that it is a new extension of human creativity.

“The metaverse isn’t about escaping reality; it’s about embracing and augmenting it with virtual content and experiences that can make things more fulfilling and make us feel more connected to our loved ones, more productive at work, and happier.” - Cathy Hackl [1]

Imagine a 3D virtual world parallel to the physical world where you can interact and spend your digital life through an avatar. Consider this as an elevation of user interface and user experience. It also brings countless possibilities for individuals and businesses from different sectors catering to diverse requirements.

Forbes has even listed the metaverse as one of the prime trends to look out for in 2023. [2] Industry leaders from various sectors like gaming, retail, architecture, media, and fashion are strategizing to establish a key position in this developing metaverse ecosystem. In 2022, global Google searches for “metaverse” increased by an astounding 7,200 per cent, according to a McKinsey report on “The Value Creation in the metaverse.” [3] Apart from Meta’s investment of a minimum of $10 billion in October 2021, other technology behemoths such as Google, Microsoft, Nvidia, and Qualcomm are also pouring billions of dollars into the development of the metaverse. [4]

The booming popularity of the metaverse has attracted companies such as Nike and Gucci as advertisers and partners to Roblox. There’s an increase in users on various metaverse platforms, with Fortnite having about 80 million monthly active users globally and Zepeto, Asia’s largest metaverse platform, registering over 300 million global subscribers. [5]

These new, immersive, virtual environments have several benefits and potential for brands to attract new customers and stay relevant with existing customers, all while using a fresh approach. The gamification of these interactive experiences aligns firmly with the interests of millennials as well as Gen Z. Brands can also take advantage of hosting virtual events like concerts or premieres to showcase their products and announce their partnerships.

According to a Forbes article on “The Future of Brand Opportunities in the metaverse,” legacy brands are implementing marketing opportunities in the metaverse. For instance, Coca-Cola has sold precious souvenirs as NFTs through auctions. Balenciaga introduced luxury items such as designer backpacks and digital clothing accessible in its virtual boutique in Fortnite. Nike chose to go all virtual and has filed for trademarks to produce digital footwear, apparel, and accessories. Furthermore, a brand can make its product more interactive by setting up a virtual e-commerce store on one of the leading metaverse platforms. Companies like Walmart and Amazon recently announced their intentions to create shopping experiences in the metaverse.

The metaverse has enabled the integration of gaming functionalities and real-world consumer activities. As a result, brands can take advantage of the vast engagement and brand recognition that comes with generating revenue from monetizing their assets.

This report will take a deeper dive into understanding the emergence of the metaverse and its impact on brand experiences and consumer behavior. It includes the technical aspects of creating, launching, and marketing a metaverse experience. It outlines the challenges faced while designing these metaverse experiences, predicts future opportunities in the metaverse, and will wrap up with a brief FAQ.

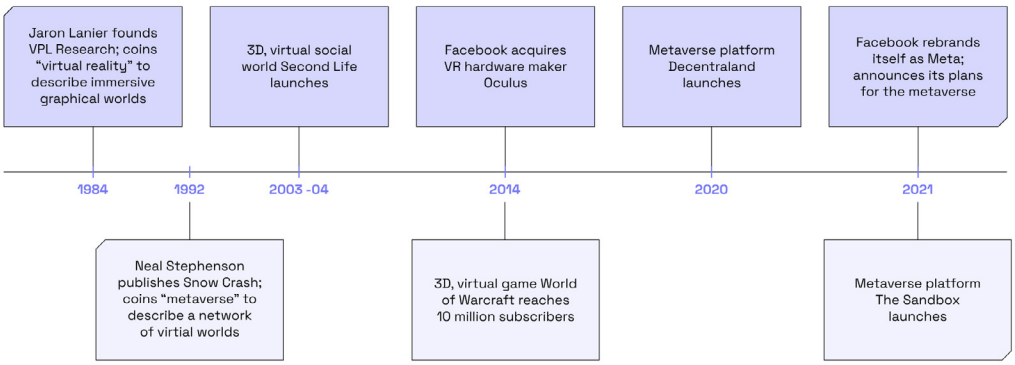

Lush in Decentraland, built by LandVault

# Part 1: Understanding the metaverse

The term “metaverse” is a fusion of “meta” (meaning transcending) and “universe” and refers to a hypothetical digital world that’s connected to the real world. Initially coined in Neal Stephenson’s 1992 fiction novel - Snow Crash, defined as an extensive virtual reality that runs parallel to the physical world, allowing users to engage with each other through digital representations of themselves known as avatars. Taking inspiration from the novel, Steven Spielberg’s Ready Player One showcased the possibilities of a fully developed metaverse.

## A Metaverse Timeline

The metaverse incorporates 3D graphics, virtual worlds, extended reality and Web3 technologies, including blockchain, cryptocurrency and NFTs.

A metaverse timeline

Though the versions of what a metaverse is have evolved, the general characteristics are summarized below:

- **Realistic immersive experiences:** The enthusiasm generated by the commencement of the metaverse is its ability to offer real immersive experiences with convincing simulations of objects, surroundings, and sensory experiences.
- **User generated content (UGC):** metaverse residents play a role in generating content and applications for their virtual world, giving rise to creativity through UGC.
- **Increase in economic value:** The creators of the metaverse follow a scarcity principle to manage and ensure the security of digital asset rights. This principle will make the data tamper-proof, and the scarcity will also make it possible to surpass the economic value of the real world.
- **Decentralized power:** The metaverse coming into play as an alternative reality has the potential to undermine the dominance of centralized power in the physical world.

- **Structured governance:** During the development of the metaverse, a clear governance structure needs to be determined. All creators must establish who has the ultimate authority in the virtual world and who possesses its economic advantage.
- **Potential for interoperability:** The potential of the metaverse to achieve interoperability is the most significant characteristic. Interoperability refers to the seamless integration of various platforms and applications for a truly interconnected virtual realm. For example, users can purchase digital items in one metaverse and then use them in another or attend an event in one and seamlessly move to another.

A few leading platforms are working towards bringing this vision to life; however, a metaverse can be centralized or decentralized. The differentiating factor between the two is how and who governs it. In a centralized metaverse, the ownership of the games or content created by a user lies in the hands of a single entity. In contrast, a decentralized metaverse allows users to retain ownership of the content they create, with control distributed among several users.

**A few examples of leading centralized metaverses include:**

1. **Second Life:** This is one of the earlier sightings of a virtual world, launched by Linden Labs in 2003. Second life engages users by nudging them to showcase their alter ego in this alternative realm rather than to take their existing real-world personas online. Second Life metaverse has about a million users today, as per research by the Massachusetts Institute of Technology. [6]
2. **Roblox:** With over 50 million daily users [7], Roblox is a prime example of a centralized network. Primarily geared toward a younger audience with a significant user base under 18 years, it offers a safe, moderated space for children. Roblox has a vast library of user-generated games covering several genres, activities, and experiences.

According to Roblox's financial report, revenue for 2022 stood at $2.2 billion, up 16% year-over-year. [8] Brands from several sectors of the physical world of fashion, beauty, music, and sports have created a presence on Roblox. The best instance is when a digital Gucci bag sold in the video game ecosystem for $4,115, more than the physical purse, which retails for $3,400. [9]

3. Fortnite: A metaverse driven by community-led content creation that has expanded itself beyond the game through its in-game live events. The game has hosted several events and collaborations with other popular brands, media, and companies. Fortnite's parent company has acquired funding of over $2 billion from Sony and KIRKBI to expand its participation in the metaverse space. Moreover, Epic Games has recently invested in a $30 million funding round for metaverse infrastructure developer Hadean. [10]

**The leading decentralized platforms include:**

3. **The Sandbox:** Started as a mobile game, Sandbox is now a part of the Ethereum blockchain and one of the first examples of a decentralized network. This virtual world launched by Pixel in 2011 offers three unique tools - Vox Edit, Sandbox Game Maker, and Sandbox Marketplace. Sandbox is known for its object creation tools that help to design 3D models and characters. Once created, these objects can convert into NFTs that can trade for SAND, the currency of Sandbox. Celebrities like Snoop Dog, Ana Ivanovic, and footballer Marco Veratti have acquired land in Sandbox. Even fashion icon Paris Hilton has declared her entry into the Sandbox metaverse to create a 'Paris World.'

4. **Decentraland:** Over the past year, the Decentraland metaverse has gained significant popularity and achieved a valuation of $1 billion. Governed by a Decentralized Autonomous Organization (DAO), Decentraland is now home to some of the world's biggest brands like Coca-Cola, Adidas, and Samsung, including luxury brands such as Dolce & Gabbana, DKNY, and Coach.

Primarily known for its real estate, lands in Decentraland can be purchased and sold using the native token MANA. Land in Decentraland has sold for as high as $2.4 million. [11]

3. **Somnium Space:** Created by Artur Sychov in 2017 and developed on the Ethereum network, this metaverse features a more realistic, architectural eye to visuals. The exclusive NFT billboards launched by Somium Space to help brand advertising, in partnership with Admix, have fetched over $1,00,000. [12]

# The impact of the metaverse on brand experience

The metaverse will become increasingly relevant to brands across various industries, from gaming and entertainment to retail and advertising. It provides new and immersive ways for brands to interact with customers and generate engagement while offering new monetization opportunities.

Analyses by several companies, such as Bloomberg, Newzoo, Statista, IDC, PWC, and Two Circles Data, show that the metaverse market has the potential to reach $783.3 billion in 2024, compared to $478.7 billion in 2020, with a compound annual growth rate of 13.1% [13]. The projected growth of the metaverse represents a significant opportunity for brands to tap into this emerging market and differentiate themselves from their competitors.

There is a significant shift in the lives and livelihoods of consumers to digital spaces and an increase in enthusiasm to spend more time and money on brands offering metaverse experiences. Around 64% of consumers have bought a virtual item or engaged in a virtual experience or service in 2021. This number is estimated to increase, as 83% of consumers are interested in purchasing through the metaverse [14].

“The metaverse era has begun, and so for consumer-facing companies, it’s not about deciding if they’re going to go into the metaverse; it’s deciding how,” says Jill Standish, senior managing director and global head of Accenture’s Retail industry group [15].

The metaverse is also transforming the way brands interact with their customers. Traditionally, brand interaction is limited to in-person and online platforms such as websites and social media. However, the metaverse has opened up a new world of possibilities for brands to engage with their customers in immersive and interactive ways.

**The following are a few existing examples of brand and customer interactions:**

- **Virtual stores:** Major brands like H&M, Walmart, and Nike have taken up space in the metaverse to launch digital store experiences, where products are tried and added to the cart. The main feature would be that the shopping carts will be portable and not tied to a specific store. For example, electronic company Samsung launched its virtual store in Decentraland with over 120,000 customers visiting to browse and purchase products, engage with in-game characters, complete missions, and more within the virtual environment [16].
- **Customer service:** A unique omnichannel immersive experience where your customer will feel valued and objective solutions given. An agent's avatar will take you through any help you require, including policies, maps of physical stores, product queries, and more. For instance, HSBC, the banking group, inaugurated several virtual stores over physical ones. The company intends to attract new customers through service solutions, gamified experiences, and marketing campaigns.
- **Advertising campaigns:** Taking it a step further from billboards and social media advertising, marketers and brands now have the opportunity to showcase their brands through gamified experiences that double up as advertising campaigns. 93% of marketers find gamification in advertising effective and plan to use it to boost brand engagement in the future [17]. The best example would be when Wendy's, the fast-food brand, created a unique event within the Fortnite game that enabled players to represent their favorite digital restaurant and fight each other. It even live-streamed the gameplay and achieved over 250,000 viewers [18].

- **Loyalty campaigns:** The metaverse, most popularly known for its community building, offers brands an added opportunity of loyalty programs consisting of digital assets and VIP rewards. Consumers can show their commitment to a brand by either purchasing digital goods or NFTs or visiting the brand's metaverse store to collect goodies. For example, Starbucks built a Reward program where consumers could take away an order from the physical store after placing an order for drinks or snacks through their virtual store on AltspaceVR. The customers who visited these virtual stores received redeemable virtual rewards to claim at the physical Starbucks location.

- **Limited edition sales:** Exclusive, limited-edition product launches call for unique events and develop brand recognition among customers. With the metaverse being the perfect setting for these exclusive launches, companies like Coca-Cola and Gucci dropped a collection of NFTs and digital products for their avatars, respectively.

- **Virtual influencers and co-creation:** In the US, a survey discovered that 58% of participants followed a virtual influencer, indicating their significant impact [19]. With millions of followers, these computer-generated characters present a unique way for brands to reach and engage with the audience. Lu Do Magalu, Miquela Sousa, Guggimon and Janky of the Superplastics, and Imma from Tokyo are a few virtual influencers who collaborated with top-notch brands from different industries.

- **Virtual experiences and events:** Brands can interact with customers by hosting unique experiences and events in the metaverse. For instance: the car manufacturer Audi created a virtual driving experience in the online game "Fortnite," allowing players to test-drive the Audi e-tron electric vehicle in a virtual environment. Other events held in the metaverse are Decentraland Fashion Week, metaverse music festival, Virtual Cannes Film Festival, and The XR summit. LandVault was one of the contributors who helped build the Decentraland Fashion Week 2022, bringing more than 60 fashion brands to the experience, making it one of the largest cultural events hosted in the metaverse. The Fashion Week attracted 300,000 attendees and achieved a 70% conversion rate on digital items during the activation.

Decentraland Fashion Week 2022, built by LandVault

These immersive ecosystems are now an integral part of brand strategies. Some of the companies **listed below have already made a big splash with their highly innovative, fun techniques to connect with customers:**

- **Louis Vuitton:** Louis The Game is a video game dedicated to Louis Vuitton completing 100 years. This fashion brand combines its heritage, innovation, and NFT art and packs it within the game world through levels accessed by collecting monogram candles. The game consists of 30 NFT collectibles, a third of the collectibles designed in collaboration with digital artist Mike 'Beeple' Winkelmann. Through gaming, Louis Vuitton attracts and maintains customer relationships with the fashion world.
- **Balenciaga:** An iconic collaboration with Epic Games, Balenciaga introduced a collection of wearables for the famous characters of Fortnite – Doggo, Ramirez, Knight, and Banshee. Apart from the digital apparel, both companies debuted a limited joint collection of physical clothing items consisting of hats, tees, hoodies, and more available for purchase from specific Balenciaga retail stores and their official website.
- **Blavity:** This media company grabbed the opportunity of shifting an in-person professional conference – 'AfroTech' into the metaverse due to the pandemic. Being one of the early adopters, the brand partnered with eXp World Holdings to create a fully customized virtual space; from prizes, workshops, pitch competitions, guest speakers, performances, and expo halls. The high success rates pushed the brand to continue offering a digital experience with an increased willingness to pay and attend.

- **Dolce & Gabbana:** This luxury fashion house partnered with UNXD, an NFT marketplace catering to digital luxury, to launch a collection of 3 digital boxes. The boxes sold were part of blind purchasing consisting of digital, physical, and experiential perks like wearables. Several buyers like Van-Soto Wright, the CEO and Founder of MoonPay, and Danilo S. Carlucci, the CEO of MorningStar Ventures, purchased the membership to the D&G NFT universe.

## Big brands are already investing, mainly in the content layer

| | | |
|---|---|---|
| **Revenues** | Incremental revenues directly linked to the sale of virtual (NFT) or real (physically delivered) products | Moncler, D&G, Walmart, Campbell's, Ralph Lauren, Gucci, Coca Cola, Nike |
| **Experience** | Complementing the omnichannel "phygital" experience and enriching the brand experience (site visit, services, brand discovery...) | Hellmann's, Balenciaga, McDonald's, Leader Price |
| **Targeting** | Ability to reach a younger and better targeted audience for the brand and its products (profile informed on the metaverse) | Van, Nike, Zara, Valentino, Marc Jacobs, Kaufland, Carrefour |
| **Communities** | Creating communities of consumers to learn from their virtual behavior and foster the collaborative process | Tommy Hilfiger, Adidas, Prada, Gucci |
| **Brand image** | Opportunity to position the brand as a trend-setting brand in a digital world | Ralph Lauren, Stella Artois, Burberry, Gap, Tommy Hilfiger |
| **Communication** | Opportunity to communicate differently about products, reinforce brand storytelling and educate consumers | Balenciaga, P&G, OTB, Louis Vuitton |

How brands are investing in the metaverse

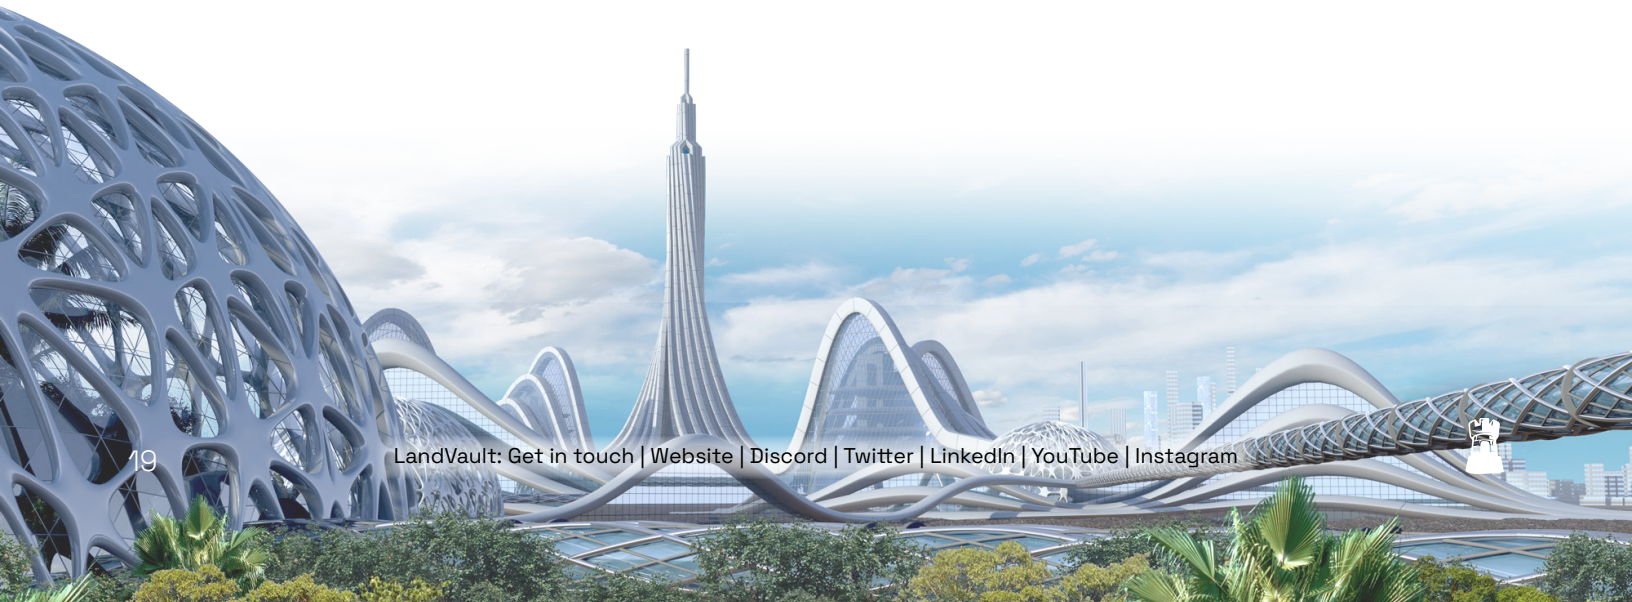

# Metaverse users and consumer behaviour

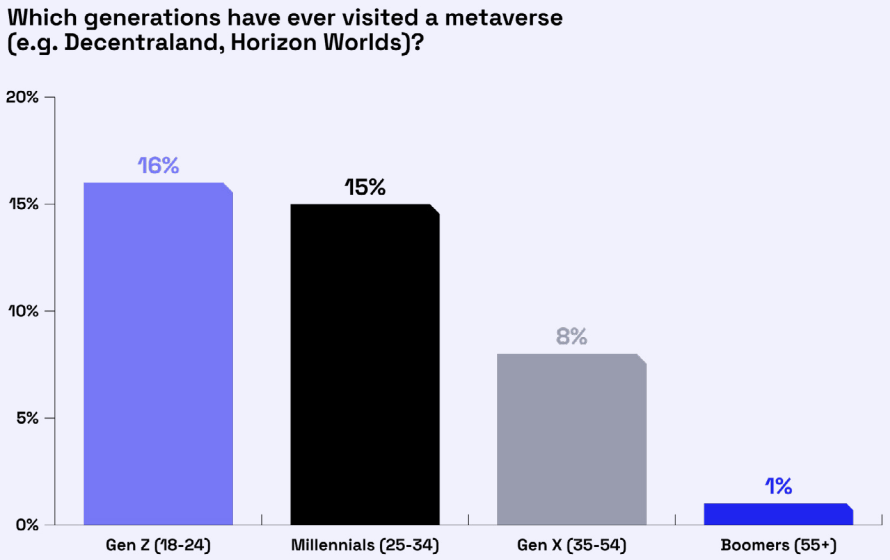

The number of metaverses and users on each of the platforms is increasing by the day. As the value of the metaverse market has grown to $47 billion [20], it's user-base can be categorized into the following groups:

**Individuals:** From attending concerts with a friend to meeting new people worldwide, the metaverse technology proves that it's here to enhance human connection and experiences. Be it a work meeting, an educational opportunity, or even shopping for products, it can all be achieved from the comfort of a user's home through this digital realm.

Awareness of the metaverse depends on several factors, with the correlation between age and acceptance being at the top. Statistics by the Adecco group state that 62% of individuals belonging to Gen Z are aware of the metaverse, and 46% believe that it will be a component of their occupation in the future, wherein the acceptance is much higher in comparison to older generations [21].

According to a study by Razorfish and Vice Media, Generation Z is more open to accepting the metaverse, with 52% feeling they can showcase their true identity in virtual gaming environments. In comparison, only 41% of Millennials and 24% of Gen X feel the same way [22]. Thus the space for self-exploration allows Gen Z to co-create a more inclusive and representative virtual environment.

Gen Z and millennials are comparatively more excited to explore the metaverse

With the digital revolution giving rise to a creator economy, individuals and creators are exploring activities that offer monetization. The common ones are NFT creation, Cryptocurrency investment, Play to earn games, Transactions of digital real estate, and more. The World Economic Forum's collaboration with Accenture states that 51% of consumers are eager to create and monetize their content in the metaverse [23]. The creator economy has significant potential for growth, with Nike's acquisition of virtual shoe designer RTFKT being an example.

**Brands:** With the boom of the metaverse, brands have found a new destination to form a bond with their customers and advertise their products. The virtual world allows users to connect with customers uniquely, innovatively, and engagingly. A significant group of consumers (52%) believe the metaverse will enhance their relationship with their preferred brand [24]. The youngest generation, i.e., Gen Z, feels that the entry of brands will make the metaverse feel real. The Razorfish study further finds that approximately one-third of Gen Z gamers have expressed their desire to see brands offering virtual stores for browsing and purchasing products within the metaverse, and 30% of them would like brands to sell skins and clothing for their avatars [25].

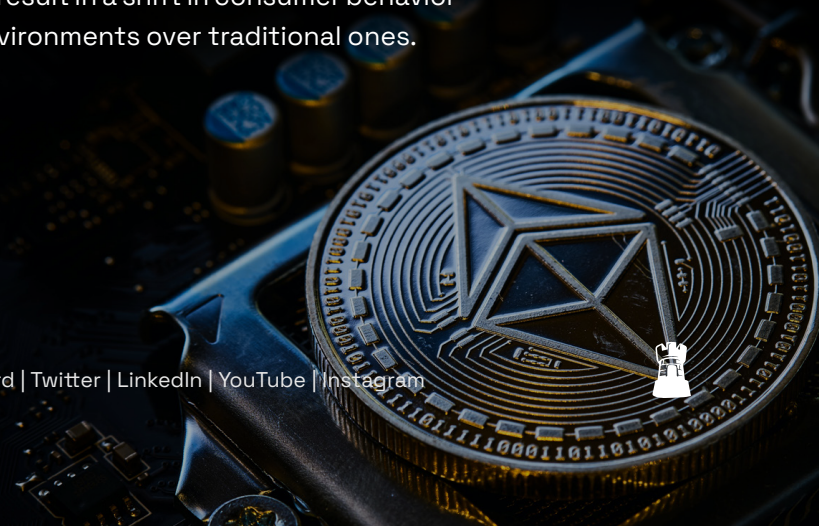

Several large corporations and brands have already set foot in the metaverse by launching digital goods and setting up physical stores to connect with new consumers or strengthen their bonds with loyal ones. Brands from various sectors ranging from Fashion, Retail, Media, Sports, Arts, E-commerce, and many others, are taking up real estate in the metaverse.

**Some of the sectors that took the metaverse by storm are:**

- Luxury Brands such as Gucci, Balenciaga, Burberry, Dolce & Gabbana, and Tommy Hilfiger have either launched virtual clothing and accessories in the form of NFTs or have opened a virtual company headquarters on the metaverse.
- Beverage brands Coca-Cola and Red Bull made their mark by selling virtual Coke products and hosting virtual events within games like Fortnite and Minecraft, respectively.
- Hyundai is one of the early adopters in the automotive industry that ventured into the metaverse by launching “Hyundai Mobility Adventure” on Roblox. This game offers a glimpse into what the future of transportation could look like when integrated with the metaverse.
- Retail brands like Forever 21, Adidas, Nike, and Vans entered the metaverse during the 2022 metaverse Fashion Week.
- Christie’s, an auction house, embraced the NFT community through its collection of digital artworks. Mike Winkelmann, a digital artist known as Beeple, earned more than **$69 million** by selling 5,000 pieces of digital artwork.

In the metaverse, individuals can be whomever they desire and engage in unconventional activities. This may result in a shift in consumer behavior as people begin to prefer virtual environments over traditional ones.

- While spending more time in virtual spaces, interaction with avatars and digital interfaces is slowly increasing. Studies show that avatar embodiment increases self-esteem, engagement, and social presence in the virtual world. Those who use avatars have reported a greater sense of community, connection with others, and increased levels of empathy than those who do not.
- Avatar customization can also influence consumers' purchasing behavior, as they are now more likely to buy virtual clothing and accessories for their avatars than they would for themselves.
- With increased interactive experiences, consumers can create a direct emotional connection with brands on the metaverse.
- They are also more likely to buy from brands they haven't purchased before, based on recommendations from virtual influencers or friends they connected with on the metaverse.
- The metaverse has the potential to blur the lines between digital and physical experiences, which may impact consumer behavior in both realms. For example, a consumer may try out a virtual product in the metaverse before purchasing in the physical world, or vice versa.

Brands must develop robust marketing strategies to enter the metaverse. To begin with, brands should have a clear idea of why they want to be a part of the metaverse and if their intended audience is already present within it. The goals can range from building awareness among new audiences to positioning and promoting loyalty with existing consumers. Brands should also recognize the metaverse platform that offers the most significant potential and is well-suited to their brand. Ultimately, companies can create tailored experiences based on their target audience. Finding the perfect balance between native advertising, immersive experiences such as games, virtual stores, events and sponsorships, and real-life activities is crucial for the organization.

**A few strategies brands can include are:**

1. **Experiment with money-making models:** According to a McKinsey report, direct-to-avatar sales of virtual goods are at a $54 billion market [26]. Though direct sales aren't a focus in the metaverse, many companies are testing different revenue generation methods. For instance, Chipotle announced in April that it was one of the first companies to allow players on Roblox to redeem virtual currency for tangible rewards. In addition, the restaurant chain gave vouchers for burritos to the initial 30,000 visitors to its metaverse location.

   Models can also include using the latest tech to create metaverse brand assets such as NFTs, Creator coins, Unique badges for digital avatars, and AR filters. Another model is for brands to create digital versions of physical products to sell on the metaverse.

2. **Replicating Web2 strategies in virtual environments:** Existing marketing channels such as social media, search engine marketing (SEO), advertising, and content marketing can help ease and seamlessly transition consumers from Web2 into Web3. Creating connections between the existing world and the new immersive world can strengthen their links and facilitate the transition process.

3. **Rewards:** Incentivize consumers by offering rewards like airtime (a low-cost marketing technique used when a loyal customer returns and works in a money-back format) and cryptocurrencies. Users can use airtime to purchase data bundles (a package for internet access). These can also be exchanged for cryptocurrency, the native currency of the metaverse. This strategy will help accelerate brand business in the metaverse.

4. **Immersive live environments:** Be it events, games, hangout spots, or concerts, brand collaboration with famous artists or other brands has proven successful. For instance, Travis Scott's nine-minute concert in the metaverse resulted in $20 million in revenue. [27]

Brands should note that – Gen Z – is one of the most significant contributors to the population within the metaverse and is more familiar with virtual worlds, digital transactions, and goods. As the oldest of Gen Z are in their mid-20s, they are increasingly close to being an income-earning force to reckon with. Gamified experiences, immersive environments, and brand collaborations on gaming platforms are just a few things that would help catch the eye of Gen Z.  A great example of successfully achieving this is when LandVault helped Hershey, the multinational chocolate manufacturer, enter the metaverse. The project work involved ideating, designing and creating the Hersheyverse. This was a gamified experience that allowed visitors to interact with their branded store and complete quests for rewards. The experience helped Hershey India and the Philippines to engage with audiences, especially Gen Z, in a completely new way.

Hershey in Decentraland, built by LandVault

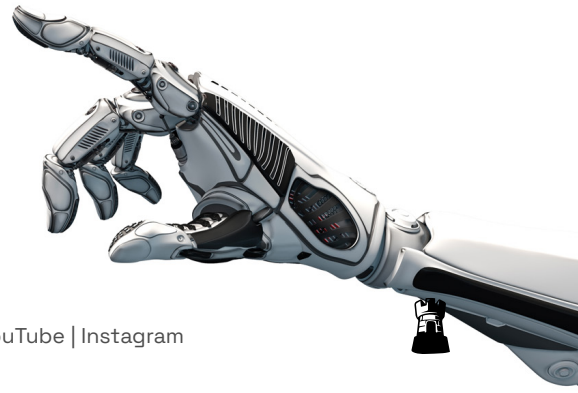

# Technical aspects of the metaverse

The metaverse is a vast virtual world requiring a complex technical infrastructure. It relies on a combination of technologies divided into smaller components:

1. **Content:** A key element to creating rich and interactive experiences is to have a wide range of content, including games, virtual worlds, socialization platforms, and other digital media. Creating and managing content requires tools and technologies like 3D modeling software, game engines, and network infrastructure.

2. **Hardware and infrastructure:** Hardware includes devices, OS layers, and peripherals to align AR and VR technologies. The underlying infrastructure required for the metaverse needs cloud solutions, stable mobile networks, semiconductors, and support for edge computing and 5G networks to facilitate the transfer of large amounts of data with minimal or no latency during interactions. Furthermore, the growing incorporation of blockchain technology into the infrastructure enables the safe and decentralized handling of digital assets, virtual currencies, transactions, tokens, and identity authentication. In addition, artificial intelligence creates more realistic and engaging experiences, such as lifelike avatars and realistic physics simulations.

3. **Platform:** Integrating different closed and open-source platforms is necessary to bind APIs and nurture interoperability to create a captivating and fulfilling experience. Interoperability also helps users seamlessly move between other virtual worlds and platforms and access metaverse tools to develop 3D experiences, define creator tools, and even create progressive AI services.

4. **User experience:** Users should be able to move through the metaverse and interact with the environment seamlessly to enhance the experience with shared interaction. The experience should be intuitive, easy to navigate, scalable, and capable of handling large numbers of users without experiencing performance issues. This also includes designing an accessible experience that considers different devices, screen sizes, and users with specific disabilities.

5. **Content creation:** Content creation and curation are critical to developing a metaverse experience. To begin with, brands must incorporate diverse surroundings and a variety of characters with distinctive narratives to keep the users engaged. Therefore, companies should develop a content strategy to encourage return visits and ensure the release of numerous concealed elements through regular updates, events, and promotions for users to uncover.

6. **Monetization:** The experience should provide opportunities for brands to reach out to customers and for users to engage with branded content, including virtual goods and services, advertisements, and subscription models. At the same time, users should feel safe from being bombarded with advertisements.

7. **Promotion and expansion:** Generating interest is one of the keys to roping people into the experience. Promote the experience through various channels, including social media, online forums, influencers, creating trailers, and other traditional marketing channels. It is also important to keep expanding and improving the metaverse experience by introducing new features and content to keep users engaged and occupied.

The metaverse will transform how brands engage with their audience, and AR/VR technologies and experience designers can facilitate co-creation in the metaverse. Designing an experience for the metaverse will be one of the challenges as it questions the basic rules of design theory.

As collaboration is essential while developing a metaverse experience, there are two critical key roles: developers and designers. Developers are responsible for the technical aspects of the experience, such as programming and ensuring the platform's functionality. On the other hand, designers focus on creating the visual and interactive elements of the experience, such as the concept art, user interface, and the overall look and feel of the experience. By working together, developers and designers can create a cohesive and engaging metaverse experience that seamlessly combines technical functionality with visually appealing and interactive elements.

LandVault helps brands navigate this evolving space with their experience developing and designing experiences. So far, LandVault has completed over 200 metaverse experiences spread across 100 million square feet in multiple virtual world platforms, like The Sandbox, Decentraland, and Somnium Space, to name a few. This was accomplished with a talented team of 120+ in-house professional builders who help bring a brand's vision to life by focusing on the technical and design aspects of the creation.

# Part 2: Creating metaverse experiences for brands

# Defining brand objectives and KPIs

Metaverse marketing is now one of the biggest platforms for brands to experiment with and gain returns. While several brands are entering the metaverse space, it is crucial to understand and set clear objectives and Key Performance Indicators (KPIs) to ensure success. KPIs are essential to track overall business and sales performances to make data-driven decisions. Key metrics include monitoring data on the number of visitors, conversion rate, and average cart value and tracking customer engagement metrics like dwell time and user journey within the store. Brands can also implement Customer Value Models (CLV) as part of the KPI to help with customer acquisition and retention, optimizing marketing strategies and experiences for increasing sales. Thus, it's essential to review marketing goals and KPIs and assess customer data quantity, quality, and utility to reach investment goals faster.

It is also important to note that regular ads don't always work in the metaverse, and businesses need to think creatively and use engagement as their main KPI. Metaverses are active, community-centric platforms that enable individual agencies and contain highly user-generated content. So, brands must focus on bringing value to the community and creating immersive experiences for their customers, all while measuring engagement metrics such as website analytics (page views, user engagement), customer feedback through surveys, and Social Media Analytics (likes, comments, shares, and mentions).

LandVault's platform provides analytics and measurements that help brands track KPIs to measure the success of their metaverse experiences. It provides data on traffic, dwell time and user journeys in the metaverse, giving brands more control over amplifying the metaverse experience.

**Some brands that have initiated metaverse campaigns with their respective objectives and KPIs are:**

1. **Hyundai** launched a metaverse space on Roblox to promote its products to increase brand awareness and engagement among a younger demographic. [28]

   KPI: To track the number of visitors in the Hyundai metaverse space and follow engagement metrics such as time spent and interactions with branded content.

2. **Nike** acquired a non-fungible token studio called RTFKT to produce digital collectibles and virtual footwear, apparel, and accessories. The objective was to expand the brand's reach and revenue streams by tapping into the growing market for digital goods.

   KPI: Conversion rate from metaverse experience to sale of virtual products, average order value, and tracking engagement through metrics like social media shares and mentions.

3. Apparel retailer **Aeropostale** partnered with **MetaversePlus** for a four-part metaverse activation plan. The objective is to drive customer engagement through experiences and promotions and understand and build a connection with the younger customer base.

   KPI: Number of new emails or contact sign-ups happening through the experience, conversion rate of exhibition leads to sales, cost per acquisition of new customers through the metaverse experience.

4. **Coca-Cola** collaborated with **Tafi** to design virtual wearables to create a new revenue stream by selling virtual products and building brand loyalty and trust among the younger audience. [29]

   KPI: Number of repeat visitors to the metaverse experience, tracking the percentage of visitors signing up for newsletters and loyalty programs, Net promoter score, and conversion rate through an increase in sales of virtual wearables and physical products after visiting the experience.

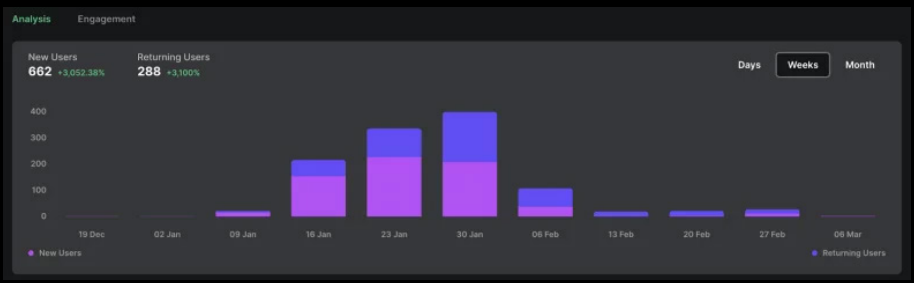

5. **Gucci** partnered with **Roblox** to create a unique and interactive virtual exhibit called Gucci Garden to showcase the brand's products in a new and innovative way and increase brand awareness among a younger demographic.

   KPI: Number of unique visitors to the Gucci Garden exhibit along with engagement metrics such as time spent in the exhibition, interactions with branded content, and social media mentions and campaign-related shares.

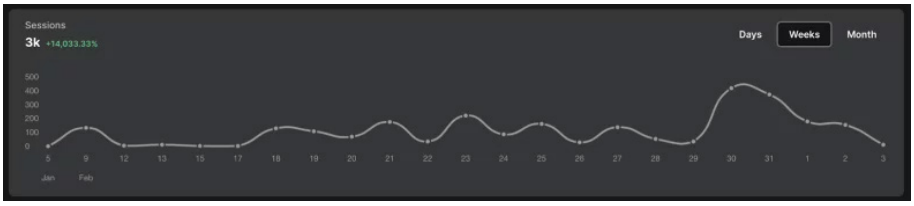

Ideally, brands need to work backwards on what they want to achieve to call the experience successful. Still, there are **several key indicators to measure the ROI of a metaverse experience:**

- **Visitors:** This shows the number of unique visitors, including new and returning users. This metric indicates the reach and popularity of your metaverse experience. A higher number of unique visitors signifies greater brand exposure and awareness, while analyzing the ratio of new to returning users can help gauge user retention and brand loyalty.

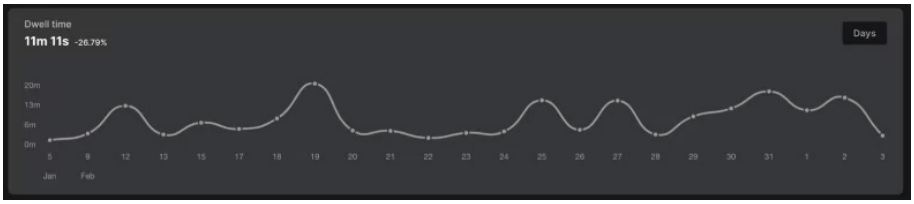

Number of visitors chart in the LandVault platform

- **Sessions:** Shows the total number of sessions started in the experience. Tracking the total number of sessions started provides insights into user engagement and can help identify patterns of usage. This information can be used to optimize the experience, ensuring higher user satisfaction and improved ROI.

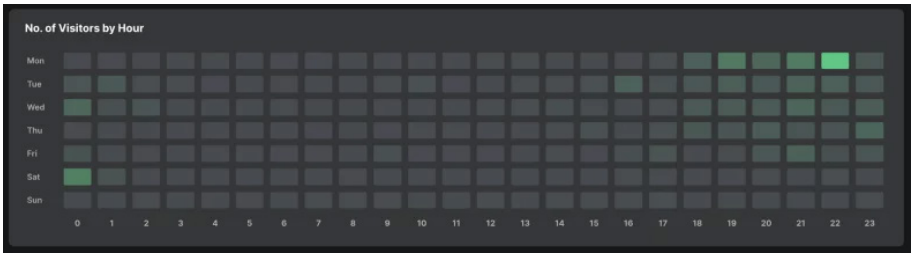

Number of sessions graph in the LandVault platform

- **Dwell time:** Collects and calculates the average time of all users connected to the experience. By measuring the average time users spend in your metaverse experience, you can assess the effectiveness of your content and design, and make adjustments to increase user engagement and satisfaction.

Average dwell time graph in the LandVault platform

- **Visitors by hour:** Shows which hours have the biggest amount of visitors in your experience. This metric can help identify peak hours and patterns in user behavior, enabling you to make informed decisions about resource allocation, live events, or promotional activities.

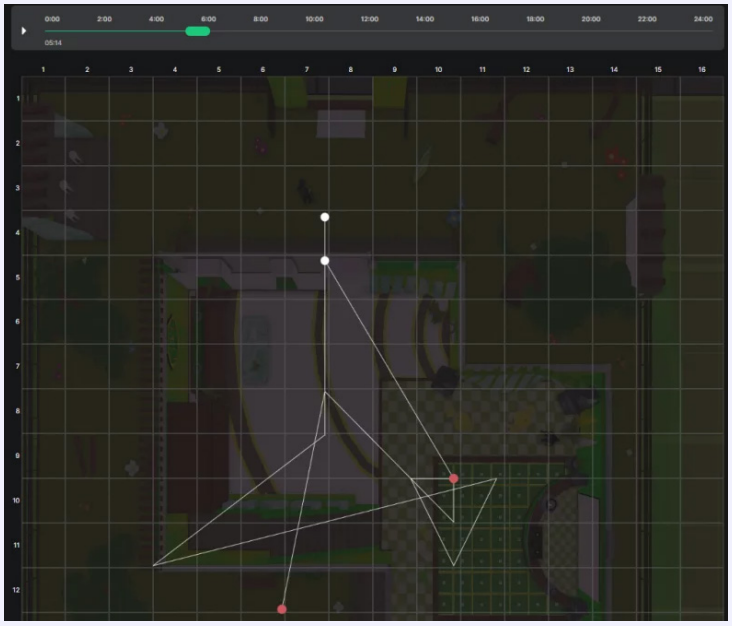

Visitors by day and time in the LandVault platform

- **Connection type:** Shows the percentage of users who signed up with a wallet or as guests. Understanding the proportion of wallet users and guest users can help tailor your metaverse experience to cater to different user segments, enhancing their experience and increasing the likelihood of conversion.

Connection type information in the LandVault platform

- **Movement:** The movement panel provides minute-by-minute user movement data within the experience for a selected date. This offers a granular view of how users navigate and interact with the metaverse environment. This metric can help organizations better understand user behavior patterns, identify bottlenecks, or uncover areas where users may be experiencing difficulties. Such insights can inform decisions around spatial design, user interface improvements, and the overall user experience, ultimately leading to increased user satisfaction and engagement.

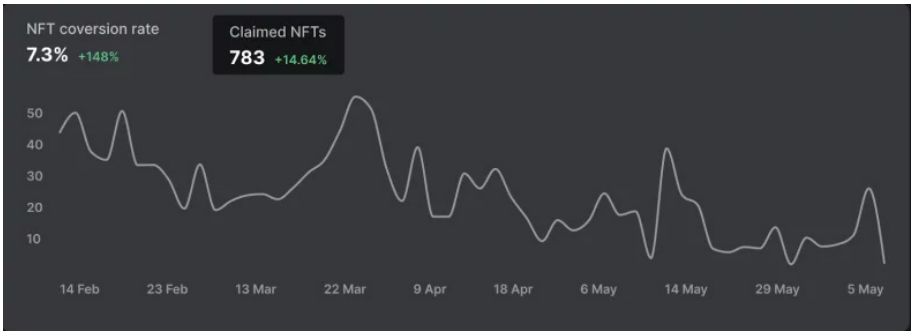

Movement tracking graph in the LandVault platform

- **Dwell:** Shows the hottest places on the experience map where players spend most of their time. By identifying the hottest places on the experience map where players spend most of their time, the dwell metric provides valuable insights into which areas or elements of the metaverse experience are the most engaging or compelling. This information can guide organizations in making informed decisions on where to focus their marketing efforts or improve the content to attract more users and drive engagement.

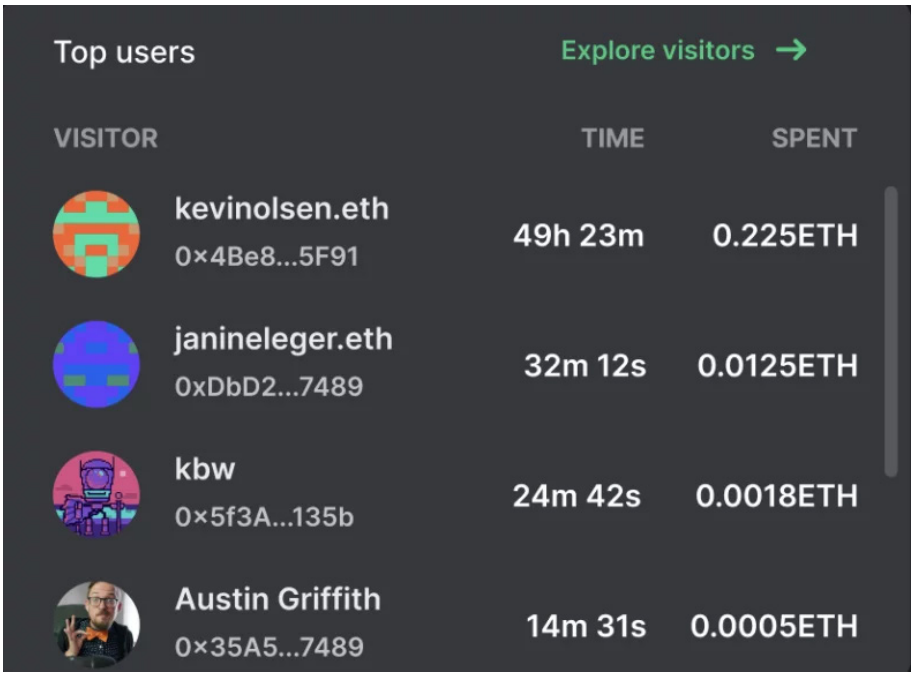

Dwell heatmap in the LandVault platform

- **NFT claims conversion:** Shows metrics on NFT claims within the experience. The NFT metrics track the associated contract address and provide metrics on the number of claimed NFTs and the conversion rate. Additionally, the delta of the previous date range is highlighted in the percentage values. These metrics are an excellent tool for tracking how many users completed the tasks to claim the NFTs and the timelines of when the claims were made.

NFT conversion rate and Claimed NFTs in the LandVault platform

- **Top Users:** Highlights top users by engagement within the experience. This information is valuable for brands as it can allow hyper-personalized targeting of the most engaged users. People who've spent more time and resources in the experience are likely to be more invested and thus respond better to continued marketing efforts.

Top Users chart in the LandVault platform

**Other useful metrics include:**

- **Metrics of engagement:** Companies can gain valuable insight into the ROI through engagement metrics by noting the time spent, the frequency of use, and the number of interactions and actions completed by an individual. These metrics can measure the effectiveness in capturing and retaining attention during the experience.
- **Revenue:** One of the most common methods is to measure the amount of revenue generated through sales, in-app purchases, and advertising. Additionally, identifying opportunities and evaluating financial performances can generate revenue from the experiences, further securing future monetization prospects.
- **Conversion rates:** The effectiveness of a virtual experience can be analyzed by monitoring the percentage of users who partake in other desired actions, including website views, social media interaction, online form registrations, sign-ups for a service, or a newsletter. This metric also gives a fair idea of how successful a workflow or a process is in guiding users and spots opportunities for improvement.
- **User feedback and ratings:** To gain a deeper understanding of measuring the success of a metaverse experience, companies can include reviews, ratings, and surveys in the process and further work on areas that require improvement.
- **Path and attention tracking:** This measurement monitors the user's routes while navigating the digital environment. Besides showing the parts of the experience that gain more attention, it can also highlight areas that need more focus. The sites gaining more attention can be used to identify upsell or promotional opportunities.

# Metaverse experience design

“The professionals of today need to start thinking in 3D because the professionals of tomorrow will already be thinking in 3D,” commented Cathy Hackl in a recent interview with Vogue. “Agencies will need to partner with people that have game design experience and game theory. They’re going to need those people that not only know how to create beautiful things but actually know how to make things work in a gamified way inside virtual worlds.” [30]

The amount of time spent in the metaverse is directly proportional to the increasing popularity among users and brands. This calls for an immersive and engaging user experience achieved only through navigation, usability, accessibility, and sensory elements of sounds and visuals. User experience in the metaverse will focus on functional design that requires users to interact with the creations and blur the lines between real and virtual. Additionally, the user experience is not limited to the metaverse and will apply to website design, content creation, and advertisements to make the transition seamless.

User experience designers need to develop for a rapidly changing environment while considering a wide range of factors impacting the experience, such as the physical and virtual environment, hardware and software in use, goals, and motivations of the users. Remembering that the user experience (UX) design is for a community-heavy virtual world is also essential. UX designers must expand their skills to consider the economy, sociology, and psychology of building a digital human society. The experience should be diegetic, intuitive, and enjoyable.

**Some key rules to building an engaging and immersive experience may include:**

- **Storytelling:** Creating a bond with users through compelling stories will give brands an added advantage. Creating consumer-led experiences and, in turn, raising awareness and exposure for the brand balances out the needs of both the users and the brands. An example of an existing narrative integrated through UX design is the skateboarding brand Vans. They created a skatepark within the metaverse, designed for users to interact with as part of their virtual stories. The park's popularity was evident, with 48 million visitors, leading to increased revenue for the brand beyond the metaverse. As a result, integrating storytelling into user experience design is a key tactic for UX designers.
- **3D tools & VR design incorporation:** Effective design includes shifting towards alternative 3D modeling tools such as Tvori and SketchUp to enhance modeling and prototyping in a 3D virtual world.
- **Seamless and consistent interface:** Create a successful metaverse by designing a plausible and coherent environment where interfaces blend seamlessly with the surroundings, similar to the physical world. The rules of interaction should be intuitive and easy to understand, ensuring a natural and immersive experience for users. Brands can further enhance the sense of immersion in the virtual world by creating realistic graphics and physics that make the objects and avatars appear more authentic within them. In addition to this, sound effects and music can enhance the user's sense of immersion and create an emotional connection with the environment.
- **Accessible and inclusive:** It is important to make the metaverse accessible and inclusive for all users, regardless of their background or abilities. From users that live in different parts of the world to easily access the digital world through any device and language or to a user who needs extra help navigating the experience, brands should provide adequate accommodations for all.

- **Customization:** Giving users the ability to customize their avatar, environment, and objects can enhance their sense of ownership and attachment to the virtual world.
- **Haptic feedback:** Haptic feedback provides a physical response to user actions, making the virtual environment more interactive and authentic. Some existing examples of this are the vibrations in a mobile phone or the rumble in a game controller.
- **Sense of community and belonging:** The design elements should encourage social interactions and user collaborations to foster a sense of community. Examples of this include group activities, shared experiences, and social networks.
- **Engaging and challenging activities:** Games, challenges, social events, or any form of entertainment - brands should harness their creativity and get users to return and interact with the experience.

To create immersive experiences in the metaverse, designers must balance key design elements: a visually stunning environment, interactive and customizable features, and social interaction. Additionally, it is essential to note that every metaverse platform has its specifications.

**Below are some of the best practices brands consider while designing for different metaverse platforms:**

- **Understand the platform's technical capabilities:** To avoid performance issues and ensure a seamless user experience, designers should understand each metaverse platform's technical capabilities and limitations.
- **Keep the user in mind:** Designers should keep the target audience in mind and design interfaces that are intuitive, user-friendly, and accessible. For example, Roblox is known to cater to a younger user base.

- **Consistency in design:** It is essential to ensure design consistency on the respective platform so that users can easily navigate the environment and avoid confusion.
- **Consider platform-specific features:** Designers should utilize platform-specific features to create engaging and immersive experiences on different metaverse platforms. Some examples are avatar customization options, socialization, spatial audio for immersive soundscapes, lighting and environment effects, smoothness of interactivity, and integration of other platforms.
- **Test the design:** Testing the design on the specific metaverse platform is essential to ensure that it functions as intended and provides an optimal user experience.

LandVault has built over 200 experiences across metaverse platforms like The Sandbox, Decentraland, Somnium Space, NFT Worlds, and has managed to create a tested and proven process to do this. Their method goes through 3 phases; finding the right digital real estate, building on it to turn concepts into implementable designs, and helping it grow through monetization and measuring of success metrics.

Euphoria, Metaverse Hospitality, The Sandbox, built by LandVault

# Metaverse content creation

Being an immersive world, metaverse content is a critical aspect that drives user engagement and builds a connection with customers on a deeper level. Compared to Web2, Web3 users prefer interactive content that can be modified and experimented with. Metaverse experiences include access to unique content such as custom-designed spaces, virtual events, and the sale of limited-edition items. Creating experiences requires access to multiple platforms and devices, including VR headsets, smartphones, and other electronic devices is also essential. Additionally, with the metaverse being a social space, user-generated content like videos, digital fashion, and games will be a significant part of the metaverse experience and keep users engaged. To further facilitate this, brands can also create experiences encouraging users to work together to build relationships and share experiences with others.

The content experienced by users can be varied. Still, there are **a few types of content that will work well in these immersive spaces:**

- **Games:** One of the most popular forms of content, with options for single-player and multiplayer modes, games range through several genres, including action, adventure, survival, strategy, simulation, and more. Creating a fun, interactive, and engaging environment, multiplayer modes are particularly popular with users. Brands can also create games that promote their products or services or sponsor existing games.
- **Virtual experiences:** Brands can uniquely appeal to users by planning virtual experiences that include concerts, art exhibits, tours of real-world locations, artist meetups, fashion shows, product launches, conferences, and more. These experiences can also contain social interactions in events, such as festivals, clubs, and parties.

- **Branded spaces:** Brands can also set up and design their virtual headquarters to showcase their products and services. The level of immersion and engagement achieved through virtual brand spaces is higher than in traditional stores.
- **Virtual products:** The increasingly popular type of content in the metaverse is virtual products created by brands, which include avatars, clothes, accessories, real estate, and more. These products have also become a new brand revenue stream and are popular among gamers and metaverse users.

Heineken Silver Brewery in Decentraland, built by LandVault

With metaverse content targeted for long-term use, constant content innovation and improvement will keep users engaged. Understanding users' interests, preferences, and behaviors in depth is essential.

**Some critical aspects of creating content that resonates with users are:**

- **Personalized content:** The demand for personalized content is rising among users, and companies can use this to drive growth opportunities. Companies can study user behavior, interests, and preferences and create targeted content that resonates with users. As the metaverse is a place for people to showcase their alternative selves, the content should reflect their character and personality.
- **Customizable content:** With a high percentage of users looking to express their individuality, companies should aim to offer tailored customization options to create a unique and personal experience. Customizable content can include avatars, virtual worlds, and other elements.
- **Collaborative content:** To build an inclusive and diverse environment, brands should collaborate while aligning the beliefs and likes of another brand or creator. Additionally, such collaborative content is vital to gain traction and introducing new users to the brand.
- **Community-driven content:** The idea of exclusive ownership by an individual company is not conducive to an open and inclusive metaverse, and community-based content is now one of the key drivers. Open-source technologies enable companies to create content supporting the community's needs, increasing engagement and providing a consistent user experience.
- **Visual content:** The metaverse being a robust visual place, allows brands to leverage visual content such as:
    - Virtual e-commerce showrooms
    - Virtual product demos
    - Virtual photoshoots
    - Gamification of commerce
    - Advanced data analytics in 3D

Content plays a crucial role in creating meaningful experiences in the metaverse. Brands that want to succeed in the metaverse must create engaging, interactive content relevant to their target audience. The metaverse offers a unique opportunity for brands to connect with users in a new and innovative way. By understanding the platform, knowing their audience, creating memorable experiences, embracing interactivity, and being authentic, brands can create content that resonates with metaverse users and build lasting relationships.

Collaborating with experts to master content creation in the metaverse will help brands leverage capabilities in the metaverse. LandVault has worked on various metaverse activations for brands, including Heineken, Mastercard, Hershey and Standard Chartered.

Hillshire Farm in Decentraland, built by LandVault

# Metaverse community management

Building and nurturing a community in the metaverse can offer a range of benefits, including ample opportunities for interaction and collaboration. Once launched, a metaverse experience or platform will only succeed if brands spread the word. Brands should use effective strategies to stand out and get noticed by the community.

**A few ways to build and nurture a community for the metaverse are as follows:**

- **Promotion through social media channels:** Reach out to a broad audience by leveraging existing social media channels such as Twitter, Instagram, and LinkedIn, as well as creating a Discord group. Using the power of social media to promote your metaverse experience and keeping your users up to date with any metaverse-related activity is a key element in increasing your metaverse user base and ensuring return visits. Increase the curiosity of users by developing a social media campaign that is both captivating and informative. Brands can achieve this through tailored video or static content for the chosen social media platform.
- **Content curation:** Depending on the platform, content needs to be curated to keep the viewers interested. However, a common thread between all platforms is for companies to use high-quality visual elements, including well-designed infographics, graphs and charts, videos, and other media. Brands can also optimize their content through industry-related keywords, adding relevant links and title tags to reach the largest target audience. In addition, blogging on relevant topics adds to the community-building process, and readers will start identifying you as an industry leader. It is essential to keep engaging with the viewers by encouraging conversations and discussions and responding to their comments.

- **Leverage influencers:** The creator economy is rising, and influencers can help boost your metaverse experience among newer audiences. But brands need to identify influencers that are relevant to the industry. Promotional campaigns with influencers will not only help in further building the community but will also help gather support and appreciation. At the end of the campaign, influencer engagement metrics can give insight into potential users and future community members.
- **Collaboration:** Besides influencer collaborations, brands can engage and rope in audiences from other sectors by collaborating with individual creators from another field or with a brand. For example, RTFKT, a next-gen sneaker and collectible creator, now acquired by Nike, collaborated with FEWOCiOUS, an 18-year-old artist. The collaboration resulted in an NFT collection that generated $3M in sales within seven minutes.

By fostering a sense of familiarity, users can feel secure and content in the metaverse, resulting in increased user engagement which is essential for the growth of the brand's metaverse platform. Furthermore, a strong community can foster innovation and creativity through idea exchange and user collaboration. Besides community building, the necessary thing for brands is to keep their users engaged through several activities, fostering brand loyalty.

**A few activities brands can follow are:**

- **Hosting events:** Bringing people together from all over creates a sense of connection and helps nurture the community. Planning an event in the metaverse will require brands to plan out details of the type of event, and activities in the event, promoting and executing it all while making sure the experience has an excellent user interface for users to feel included and engaged. LandVault helped World of Women, a Web3 community celebrating representation, elevate engagement with their community by building a fantasy world in the metaverse where the audience could interact with futuristic art, quests and trivia.

- **Providing unique rewards and incentives:** Providing unique benefits and incentives, such as rare virtual objects or in-game advantages, to metaverse users can help foster a sense of loyalty and commitment.
- **Encouraging user-generated content:** Metaverse brands can inspire users to produce and distribute their brand-related content to establish a feeling of ownership and community.
- **Customer relationship management (CRM) and loyalty programmes:** Form a social connection with customers through surprises and gain loyalty with points or membership cards. Loyalty cards can be in the form of NFTs utilized for various purposes in loyalty programs, such as earning and redeeming for offers, completing tasks, achieving status levels, and obtaining digital or physical goods. Brands can use the metaverse or Web3 to enhance their customers' social, structural, and emotional experiences. For instance, Starbucks is already creating engaging metaverse experiences through loyalty points.
- **Embracing diversity and inclusivity:** By creating a welcoming and inclusive environment in the metaverse, brands can demonstrate their commitment to diversity and build a loyal following among users who share these values.
- **Personalized experiences:** Brands can use data and analytics to personalize the user experience in the metaverse, offering tailored recommendations, promotions, and other perks that align with users' interests and preferences.
- **Social causes:** Companies that promote social responsibility and align with social causes in the metaverse can gain the loyalty of users who share these values and want to support businesses making a positive impact.
- **Value beyond the metaverse:** Brands can offer value to users beyond the metaverse, such as discounts on real-world products or access to exclusive events and experiences.

To build lasting trust between the brand and the community, brands need to have a framework in place to respond to negative feedback and manage their reputation.

1. **Acknowledge** the user's effort to reach out and create a sense of respect and comfort. Brands should actively listen to show that they are addressing the issue.
2. **Acceptance** is a must if the feedback received is proven correct. Companies should, however, thoroughly investigate the matter before accepting.
3. **Communicate** with transparency, clarity, and efficiency to show the user that their time is valued, and a quick response will also help maintain the brand's reputation. In addition, personalized touch to the messages will speak volumes regarding care and concern regarding the issue.
4. **Resolving** any negative feedback and leaving the user satisfied with the decision should be the primary aim of any company.

Finally, companies can use the metaverse's capabilities to exhibit their dedication to social responsibility and interact with users to build a positive reputation. It is also crucial for brands to keep track of their online presence consistently and take suitable measures to manage negative feedback or comments.

LandVault designed and built WOW Galaxy in the Sandbox for World of Women

# Part 3: Launching and marketing a metaverse experience

# Pre-launch preparation

Building and nurturing a community in the metaverse can offer a range of benefits, including ample opportunities for interaction and collaboration. Once launched, a metaverse experience or platform will only succeed if brands spread the word. Brands should use effective strategies to stand out and get noticed by the community.

"Metaverse is all about the revolutionary internet. However, the process to accommodate evolving standards requires keeping the user experience central. Quality Assurance is the key to frictionless architecture and dynamic balance between hardware, platform, and services in the metaverse." - Kanika Vatsyayan, VP, Delivery & Operations of Bug Raptors [31]

The success of a metaverse experience will depend on the ability of companies to offer innovative features and a smooth user experience.

**It is vital for organizations to test their experience before launch, with methods listed below:**

- **Performance testing:** An effective way to identify limitations and eliminate performance bottlenecks. Testing the experience's performance determines the solution's stability, speed, scalability, and responsiveness under a given workload. It can also provide insights into its ability to handle the expected user load over time, its power to manage high traffic and data processing, and its capacity to handle a higher user load.
- **Usability testing:** Assessing the user's experience to identify any issues or flaws with the overall quality of the platform, including the AR and VR experiences, design flaws, and general user interaction. It can map out how intuitive the product is and how the user feels about it.

- **Audio and video quality testing:** With varying network connections and types of devices, the quality of media content used in the experience will differ. Accessibility of content across all channels, along with prime media quality, is crucial for user retention. Audio and video quality testing will give insight into end-user experience, resource utilization, and behavioral analysis in low network conditions.
- **Interactive and immersive testing:** The users are the key determinant of the success of the metaverse, and therefore, metaverse experiences must be interactive, immersive, and accessible, requiring a thorough testing approach to ensure their functionality. Companies should consider implementing cross-application testing for their experiences; for instance, testing a user flow that involves multiple applications for shopping, purchasing, and scheduling delivery.
- **Security testing:** While the metaverse is scaling, the chances of potential vulnerabilities like cyberattacks, the safety of user data, and product safety from intruders are also increasing. Security testing is thus a vital aspect of the software development life cycle (SDLC). It must keep improving to keep up with the evolving tactics of hackers in the metaverse.
- **Accessibility testing:** The development phase of an experience should focus on accessibility for different age groups and physical disabilities and for quick and easy navigation. Post development stage, the testing phase should include aspects like closed captions for video and audio, alternative control usage to help navigation and execution, use of alt tags for visual elements, and high contrast text compared to the background.
- **Platform testing:** The metaverse heavily relies on APIs - Application Programming Interfaces, for creating an immersive experience through effectively integrating platforms, tools, and user experiences. Achieving interoperability across APIs is crucial to ensure seamless interactions during experiences.

However, as the metaverse expands, API specifications become more complex, requiring regression testing (to test previously developed software features and ensure they work as intended after the changes or updates) and cross-platform activity. Testers must understand software systems, achieve flexibility, and harness decentralization to work on metaverse platforms. Developers must build classes and module support tests (used to identify bugs or issues in individual software modules) before launching the metaverse experience. It is also essential for testers to run unit test tracing for every new API, similar to a traceability matrix (a document that links the software requirements to their test cases and ensures complete testing and verification of all prerequisites) for hardware testing.

It is also crucial for companies to keep in mind the budget and allocate resources for their metaverse campaigns. The expected costs taken into consideration are:

- **Web3 development costs:** This typically covers the expenses associated with developing decentralized applications (DApps) and smart contracts on blockchain platforms. It can include charges of hiring a development team to deal with blockchain programming languages, acquiring or renting infrastructure such as servers and storage for hosting DApp, transaction fees for the blockchain, testing and auditing costs, security and maintenance fees, and costs for integrating with other applications.
- **Metaverse deployment costs:** This calls for expenses involved in creating, launching, and maintaining the campaign on the metaverse platform. The costs include:
    - Purchasing land.
    - Building the infrastructure.
    - Creating digital assets such as virtual environments and assets.
    - Interface testing.
    - Providing user support and customer service.

| **Price** | Starts from 1.7 ETH | Starts from 6 ETH | Starts from 3 ETH | Starts from 14 ETH |

Costs of land in different metaverses by Nexa -
"How much does it cost a Company to be in The Metaverse"

- **General operational costs:** Brands should consider the ongoing expenses to keep the campaign running. Costs include salaries to maintain and improve the campaign, rent for office space and other facilities, third-party fees such as payment processors and customer support tools, Legal and regulatory compliance, insurance, and additional risk management costs.
- **Marketing costs:** Promoting a metaverse campaign is the most crucial part of achieving success, and this can include expenses of search engine marketing, social media marketing, influencer marketing, paid promotion and advertising, metaverse advertising, and other traditional marketing methods.

Testing a metaverse experience during the prelaunch phase and conducting proper resource allocation for the launch can be daunting for those unfamiliar with the metaverse and its best practices. Support and advice from experienced experts in the field can be extremely beneficial for a successful launch. LandVault, the largest builder in the metaverse, helped SC Ventures enter the metaverse by providing an end-to-end solution to create a gamified experience to educate users on digital assets and financial wellbeing.

LandVault helped SC Ventures launch in The Sandbox

# Marketing and promotion strategies

Lessons are already emerging from companies that have succeeded early in the metaverse. Although marketing in the metaverse can resemble designing brand experiences in the physical world, applying these elements can be very different. Effective engagement of consumers in the metaverse will require its own evolving recipe for success as online approaches for driving value continue to grow.

**To market a metaverse experience to a broader audience, brands can use strategies such as:**

1. **Social media marketing:** Promoting the metaverse experience through social media channels like Twitter, Facebook, Instagram, and LinkedIn to reach a mixed audience.
2. **Influencer marketing:** Collaboration with influencers with a large following on social media platforms can help promote the metaverse experience to new followers.
3. **Community engagement:** Building a community around the metaverse experience and engaging with users through forums, blogs, and social media.
4. **Paid advertising:** Brands can also use paid advertising methods to target specific audiences and increase the visibility of the metaverse experience.
5. **Events and sponsorships:** Participate in events and sponsorships related to the metaverse and promote the brand's metaverse experience to a wider audience.
6. **Content marketing:** Creating informative and valuable content such as blog posts, videos, and infographics to educate and attract users to the metaverse experience and be noticed as a thought leader.

7. **Public relations:** Building relationships with media outlets and journalists to get coverage and increase the metaverse experience's visibility.
8. **Email marketing:** Activate existing contact lists with relevant and targeted emails.

A promising marketing and promotion strategy in the metaverse was delivered by LandVault along with agencies VIA and Carat for Mastercard, as they launched the Pride Plaza in the metaverse - a part of their 'Your True Self is Priceless' project. The experience leveraged influencer marketing by tying up with creators like Shanée Benjamin, Rahemur Rahman and Laurel Charleston to launch a collection of wearables as a part of the experience, of which 1000 were redeemed during the activation. They also created live events and interactions, leading to up to 100,000 minutes spent by audiences in the experience overall.

Mastercard's Pride Plaza in the Decentraland, built by LandVault

Social media has immense power in today's digital age, enabling individuals and brands to connect and engage with vast audiences. Brands can leverage social media to share information on their metaverse campaigns, sustain communities and reach newer audiences.

- **Identify** the social media platform where their target audience is the most active and tailor the content for increased engagement.
- **Create** engaging metaverse-related content so that viewers can share it.
- **Collaborate** with other thought leaders and influencers who have a following within the metaverse community.
- **Promote** events and experiences in the metaverse and generate buzz through teasers and behind-the-scenes content to create excitement around the metaverse campaign.
- **Increase the reach and visibility** of the metaverse campaign by creating unique hashtags or using existing ones relevant to the industry.
- **Host** contests around your metaverse campaign on social media to create user-generated content and engagement.
- **Engage** with the audience by responding to their messages and comments to build trust and loyalty.

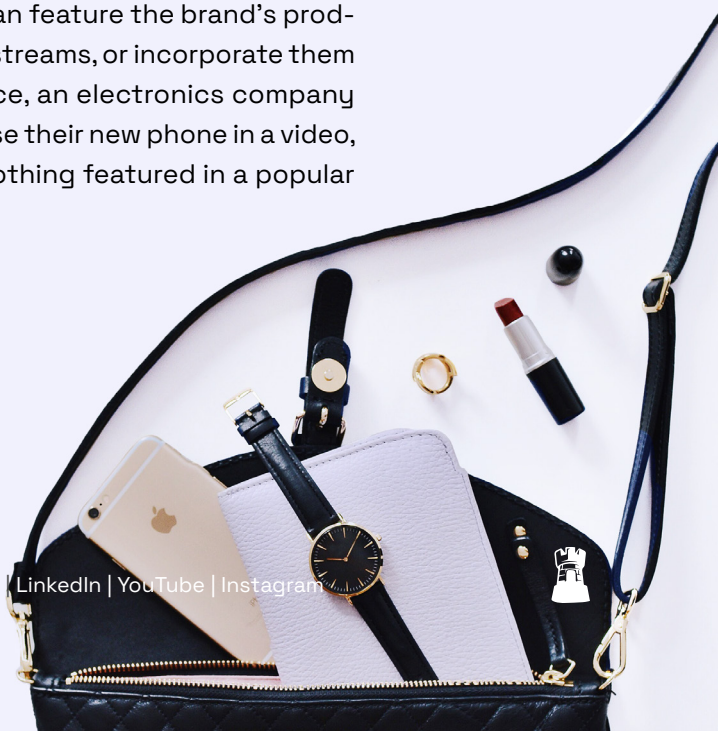

By collaborating with individuals with a significant social influence and following, brands have been leveraging influencer marketing for a long time. Influencer marketing has played a substantial role in helping brands promote their products or services and has effectively reached their target audience.

A new era of influencer marketing has started, and now influencers with a significant following in the virtual world have new ways to monetize their content. Influencers are at the center of attention, with brands needing to develop more immersive ways to showcase their product and services. From physical environments, influencers are now translating and spreading awareness in virtual environments. The stark difference between web2 and web3 influencers is that these metaverse influencers are computer-generated characters with verified social media accounts and a vast human following. Brands collaborate with these virtual influencers to promote their products and offer customers unique discounts or content. This way, brands can create awareness and reach an engaged audience interested in the virtual world.

**Some ways in which brands can leverage influencers to achieve results in the metaverse are:**

- **Sponsored experiences:** To leverage influencers in the metaverse, brands can support experiences aligning with their message, such as creating a virtual world or including branded content in existing experiences. This strategy allows brands to reach a large audience of interested users and work with popular creators to create engaging content that promotes their products or services. For example, A clothing brand can partner with an avatar designer to create virtual wearables promoting its latest collection in the physical world.
- **Product placements:** To place their products in virtual worlds, brands can collaborate with influencers who can feature the brand's products in their content, such as videos or streams, or incorporate them into the virtual world itself. For instance, an electronics company might partner with a vlogger to showcase their new phone in a video, while a fashion brand could have its clothing featured in a popular stream.

- **Events:** To promote metaverse events, brands can collaborate with influencers by having them attend and stream the event or mention it on their channels. For instance, a vlogger could host a live stream of a gaming company's latest tournament in the metaverse.
- **Quizzes and contests:** Brands can involve influencers to create quizzes or run contests based on the brand's product and services and post them on their stories or feed for audiences to engage with the content.
- **Interviews:** To utilize influencers, brands can collaborate with them to conduct interviews with individuals affiliated with the brand or other famous influencers from the industry.

When it comes to leveraging the power of influencer marketing for brands, various methods are available, each with its advantages. However, collaborating with creators can be especially advantageous as it allows brands to reach a vast audience in numerous ways. Apart from famous virtual influencers like Nobody Sausage, Caballo Perro, Kyra, Shudu, Imma, and Lucy, there are over 150 virtual influencers, according to Virtual Humans, a website tracking virtual influencers across all platforms. [32] Some real-world influencers include YouTuber Markiplier, musician Grimes, and entrepreneur Gary Vaynerchuk.

The metaverse also offers a chance to reconsider how digital metaverse advertising operates and the value it brings to all parties. As the metaverse develops, it is essential to establish the appropriate advertising foundations to maximize its potential.

- **In-metaverse advertising:** Virtual billboards are commonly used for metaverse advertising in platforms like Roblox, Fortnite, and Decentraland. This advertising model has proved successful for in-gaming advertising on platforms like Tiki-Taka Soccer and FIFA Mobile, now adopted by brands such as Coca-Cola, Samsung, Balenciaga, and Adidas, increasing their presence in the metaverse. While it may seem old-school, virtual billboards and banners remain an untapped advertising channel in the metaverse.

- **Advertising through metaverse events:** Large-scale entertainment events are an excellent way of converging traditional and interactive advertising. For instance, Travis Scott, Lil Nas, and Ariana Grande have attracted millions of fans with their concerts on platforms such as Fortnite and Roblox, which have set the standard for reaching large-scale audiences through entertainment events. Brands can use subtle product placements or full-scale advertisements during events in the metaverse.

Advertising in the metaverse is currently an affordable option, and brands can use this as a lucrative opportunity to target new audiences. An instance of a successful metaverse advertising campaign is the Gucci Garden campaign set in a virtual space within Roblox. Users could navigate through a forest-themed scenario and browse Gucci's digital fashion collection simultaneously.

**The key benefits of advertising in the metaverse are:**

1. **Unlimited turnout:** As there is no limit to the number of people entering and experiencing the metaverse, an advertisement within it can reach a million people.
2. **Boundless infrastructure:** With no restraints of real-world issues like space, gravity, and budget, brands can go all out while creating an advertisement within the metaverse.
3. **Personalization:** Brands can tailor their advertisements to catch the attention of their targeted user and create a deeper relationship by following a one-on-one strategy.

Some challenges that brands can face while advertising in the metaverse is as follows:

- Lack of data privacy
- Failure to moderate and regulate content in decentralized metaverses
- Difficulty in tracking precise metrics

In the next section, we'll explore overcoming these and other challenges.

# Part 4: Challenges and opportunities in the metaverse

# Ethical considerations in the metaverse for brands

Metaverse technologies are evolving rapidly, and while they present a range of benefits, there's still a knowledge gap in the ethical consequences these tech advancements present. [33]

**A few ethical considerations in the metaverse for brands are:**

- **Mental privacy:** The metaverse can collect rich user and customer data. Understanding what is ethical to collect and what is not will be essential to avoid infringing on users' mental privacy. Brainwave and biometric data could be collected using these technologies to control users' thoughts in the metaverse. Users must be assured of mental and biological privacy, where data is not manipulated to influence their behavior.
- **Socio-ethical challenges:** While the metaverse is built to bring people together to share experiences, it could be easy to isolate those unable to access the platform due to a lack of funds or access to the right equipment. Ensuring people can access the metaverse by designing technology that a diverse group can effectively use will be essential. It is crucial to create an inclusive space that can connect people from different backgrounds or those with disabilities without sidelining them.
- **Privacy concerns and data flows:** Data collection of users in the metaverse could be more intrusive than on other platforms. This raises ethical considerations about how brands and companies can use data collection for entertainment. Metaverse platforms and companies building in the metaverse must determine how an individual's sovereignty is maintained. They will also need to ensure appropriate opt-in rights are in place.

- **Privacy concerns and data flows:** Data collection of users in the metaverse could be much more intrusive than on other platforms. This raises ethical considerations about how the data collected can be used appropriately solely for entertainment purposes. Metaverse platforms and companies building in the metaverse must be responsible for determining how an individual's sovereignty is maintained. They will also need to ensure appropriate opt-in rights are in place for using data collected for AI training and other purposes.

# Legal considerations in the metaverse for brands

Users are advised to stay informed about the laws related to the metaverse and consult legal experts to ensure compliance. **Some legal issues that brands can face are:**

- **Conduct and behavior:** The metaverse is a digital space for social interaction between individuals through their avatars, which could lead to misconduct between people. Complexities arise concerning criminal laws and how they apply to avatars, which require them to be considered legal personas to sue or be sued. To counter these issues, platforms and companies must establish a legal framework to prevent harassment and bullying. The framework includes implementing clear user behavior and moderation guidelines, providing reporting mechanisms, and partnering with organizations that promote online safety. Brands can also seek user feedback and incorporate their concerns into their metaverse experiences.
- **Cybersecurity and privacy:** Within the metaverse's Web3 environment, new digital products and avatars are creating new formats of data, different levels of sensitivity, and evolving rules around ownership. This could lead to risks like identity theft, financial losses from security breaches, and more. These rising risks in the digital space require governments to reevaluate the validity of current data protection laws and cybersecurity protocols. Developers building metaverse experiences must also have the appropriate guidance to create a privacy-focused metaverse experience protecting vulnerable populations.
- **Intellectual property (IP):** In the metaverse, geographic boundaries and territories are taking on new meanings leading to a challenge in defining IP, ownership, protection, piracy, and patent issues. Users could dispute IP created by avatars and AI by questioning its validity. To avoid these disputes, creators and brands in the metaverse must clearly understand their usage rights and applicable licenses.

# Challenges in the metaverse

1. **Inadequate understanding of the medium**

   Navigating the new concepts behind the metaverse is a challenge for brands exploring the landscape for the first time. With the right level of knowledge, brands can avoid making wrong assumptions, targeting audiences incorrectly and failing to execute a successful metaverse experience.

   **Solution:** Brands can seek advice from experts or experienced developers if they need more expertise creating a metaverse experience. Furthermore, they can conduct research and analysis to understand the metaverse and its impact on their brand. Brands can also experiment with small-scale metaverse campaigns to test and learn from their achievements and setbacks.

2. **Insufficient planning and development**

   Launching a successful experience in the metaverse requires brands to consider several technical aspects, rules for experience design, and strategizing to monetize the experience.

   **Solution:** To avoid this, brands should establish specific goals and objectives by creating a detailed roadmap and identifying their target audience. Collaborating with skilled metaverse developers and allocating resources toward top-notch design and development can ensure a seamless and engaging user experience.

3. **Limited accessibility and inclusivity**

   Engaging with metaverse experiences often requires expensive AR/VR tools that limit access to a small user group. Digital experiences are also more challenging for people with disabilities to enjoy if they are not tailored to their needs.

**Solution:** Brands should design and develop inclusive systems and accessible experiences from the initial stages to empower users and help them reinvent themselves. It is essential to cater to users with disabilities, language diversity, and different device usage.

4. **Poor user experience**

   Designing a metaverse experience for users with assets and interactions for a 3D space is complex for most creators and brands new to the concept. In most cases, designs that are natural for 2D spaces need to be completely redefined for the metaverse's 3D landscape. Without the right skills, brands are at risk of designing awkward and unintuitive interfaces.

   **Solution:** To ensure a well-designed and user-friendly experience, brands can conduct user testing and incorporate feedback from beta testers to improve the experience. Clear instructions and guidance for navigating the metaverse experience can also be provided, along with customer support for any technical issues or questions.

5. **Negative impact on brand reputation**

   Like other social interaction platforms, the metaverse could also lead users to engage in harmful activities like circulating fake news or spreading hate speech. Brands could bare the brunt of these activities if they are not kept in check.

   **Solution:** By monitoring and moderating user-generated content, brands can ensure appropriate behavior and avoid any impact on their reputation. Brands must communicate transparently and honestly and promptly address any issues or concerns. In addition, brands should have a crisis management strategy ready to handle unexpected matters or negative publicity quickly and effectively.

6. **Ineffective monetization strategies**

   Brands must understand how the metaverse can be leveraged to create opportunities for monetization without compromising on the ultimate metaverse experience and user privacy. Direct sales may not be the top solution for the metaverse, which is why brands must explore other revenue streams to avoid missing out on capturing income through other ways.

   **Solution:** Brands can use alternate options of adding new revenue streams such as virtual goods, experiences, subscriptions, and advertising and introducing data-driven pricing strategies, all while balancing user satisfaction.

7. **Difficulty in measuring success**

   KPIs in the metaverse go well beyond measurements of revenue, sales, customer retention or satisfaction. In the metaverse, what matters most for brands is to ensure they are measuring engagement. However, defining the right KPIs to measure and collecting the right data can sometimes be challenging for brands.

   **Solution:** Setting clear and measurable goals, such as engagement metrics, user acquisition, and return on investment, is the first step to measuring success. Brands can employ data analytics and insights, such as the ones provided by LandVault, to monitor user behavior and preferences and constantly improve their metaverse experience for better performance. Moreover, brands can use feedback to evaluate their metaverse campaign's influence on brand awareness, perception, and loyalty.

# Opportunities

Goldman Sachs forecasts rapid growth in the metaverse in the coming years, with an estimated 15% to 33% of global spending on digital transactions eventually transitioning to the metaverse. [34]

**Some of the predictions for the future of the metaverse include:**

1. **Metaverse could be mainstream in the next 3-5 years**

   Early adopters of the metaverse have started the research and development of the metaverse, and it is predicted to go mainstream in a few years as more businesses join in. The metaverse is expected to be the next social media platform where brands can promote and sell their products and services in a seamlessly interactive way.

2. **Design and tech services will be in extremely high demand**

   In the initial stages, brands will require to create relationships with contractors, consultants, and specialist workers in the design and tech fields. Design and tech specialists are essential to creating a brand identity in the metaverse in a safe, engaging, and visually appealing way.

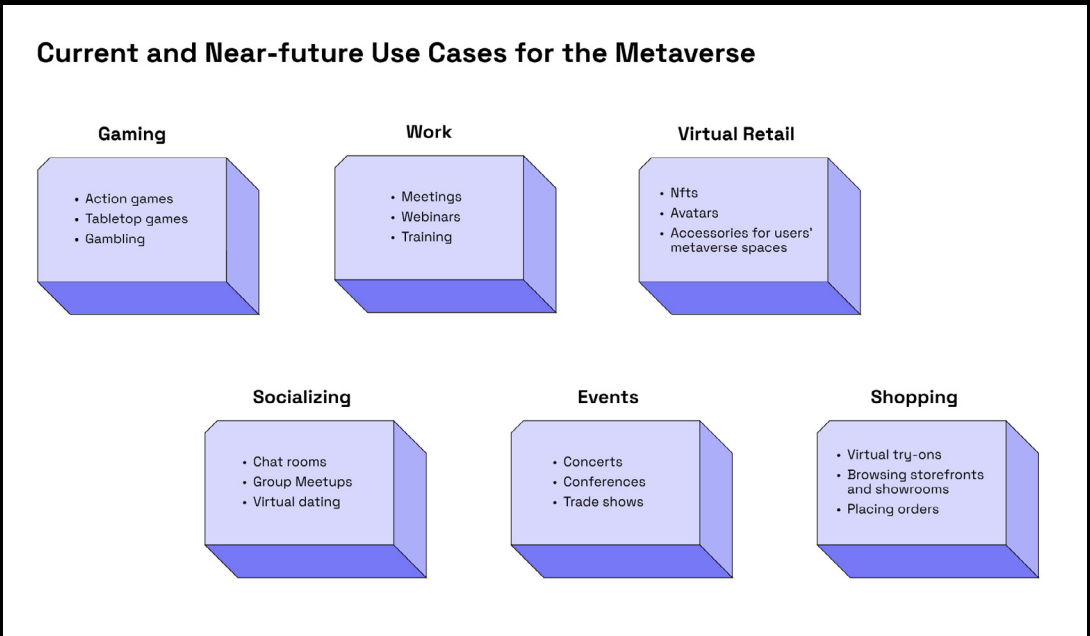

3. **Standardization is coming**

   Currently, there is an existence of two different visions of the metaverse - centralized and decentralized. Platforms like Decentraland and Sandbox advocate for a decentralized and interoperable metaverse, which aligns with the principles of decentralized finance (DeFi) and decentralized autonomous organizations (DAOs). However, we would likely still need standardization to build a truly interoperable metaverse.

4. **The future of virtual reality will be dominated by AR and MR**

   Augmented Reality (AR) and Mixed Reality (MR) are vital technological advancements that are a part of artificial intelligence. Virtual reality (VR) is expected to have a smaller but passionate user base, primarily consisting of gamers and entertainment enthusiasts and specific industries such as corporate, medical, educational, and training environments.

Current and near-future use cases for the metaverse

Major companies and brands are investing heavily in the metaverse, and this technology could be a game changer for brands in the future. Ashish Agarwal, Co-founder of Lepasa (a metaverse with real life use cases and fine art NFTs), suggests that brands can use digital avatars and non-fungible tokens (NFTs) to engage with customers on metaverse platforms and create virtual communities to build and maintain relationships with potential buyers. [35]

Meanwhile, Kunal Bajaj, the Chief Business officer of eSec Forte (a CMMi Level 3 certified Global Consulting and IT Security Services company), recommends that brands experiment with traditional marketing approaches and adopt an integrated and holistic approach to customer acquisition and retention. Brands can create virtual worlds and digital properties to advertise and promote their products and services to prospective users. They can also use digital twins of famous personalities and organize virtual concerts to build long-term relationships with target audiences. With virtual commerce accounting for nearly half of the total gaming revenue online, the future trade on metaverse platforms will become more seamless and unhindered. Users in metaverse platforms will lead brands' promotional and marketing efforts by offering suggestions on creating engaging customer experiences.

# Conclusion

In conclusion, the metaverse presents a vast new frontier for brands to create immersive and engaging experiences. From analyzing the impact of the metaverse on brands and consumers to understanding the technical aspects and unique features of various metaverse platforms, brands and designers can come together and take advantage of the unique characteristics of the metaverse to create experiences. In this process, it is also essential for brands to set clear goals and use KPIs to leverage digital content like avatars, NFTs, virtual goods, and digital communities; to foster brand loyalty and capture the attention of younger audiences. Brands can also experiment with marketing strategies by creating gamified experiences, leveraging traditional social media, or using virtual influencer marketing to promote their goods or services. As the metaverse evolves and becomes more widespread, it will be necessary for brands to keep identifying challenges and solving challenges by searching for effective solutions. Lastly, companies must adopt the metaverse, define their position and strategy, and continuously enhance their core competencies and ecosystem development to leverage its potential. Above all, they should collaborate and engage in dialogue to explore the metaverse together.

Collaborating with expert creators and builders in the metaverse will define which brands can capitalize on emerging opportunities and launch successful experiences. LandVault, the world's largest metaverse developer and builder, offers brands and organizations end-to-end creative and technology solutions to enter the metaverse. Having built over 200 experiences in the metaverse for clients like Mastercard, Standard Chartered, Heineken and Hershey, with the support of over 120 in-house builders and artists, LandVault is leading the way for brands to break through into the metaverse.

**Frequently asked questions (FAQ's)**

1. **What is the difference between the metaverse and virtual reality?**

   In virtual reality, users are limited to exploring the world created by developers and designers. In contrast, the metaverse allows users to create their reality and encourages a community-led environment. The metaverse is also a network of interconnected virtual worlds with economies, digital identities, decentralized government, and other systems in addition to games and social media.

2. **How can small businesses benefit from the metaverse?**

   The metaverse is a valuable tool for small businesses to promote their products and reach a global audience. Brands can use this interactive environment to create engaging consumer experiences and build brand loyalty. Building a storefront in the metaverse will also be a cost-efficient solution for smaller brands over purchasing physical real estate.

3. **What are some ethical considerations when creating metaverse experiences for brands?**

   Brands should be aware of ethical implications like user privacy, data security, inclusivity, authenticity, and their impact on society.

4. **Are there any legal issues to consider when creating metaverse experiences for brands?**

   Brands should set a legal framework concerning user behavior, trademarks for brand assets, and the transaction of ownership post-sales. Also, brands must follow advertising regulations and review terms and conditions to protect digital assets.

5. **What are some examples of successful metaverse campaigns by brands**

   Some examples of successful metaverse campaigns are:

   - Nike virtual store selling a limited-edition sneaker collection on Fortnite
   - Heineken building a virtual brewery in Decentraland to engage with their community, which won them the Cannes Lions awards
   - Hershey creating a fully-branded gamified experience in the metaverse to interact with their target audience during holiday season
   - Louis The Game launched by Louis Vuitton with in-game NFT collectibles
   - Themed on the historic New York City Pride, Mastercard created the Pride Plaza, a digital activation in the metaverse, to help echo their brand values
   - Decentraland Metaverse Fashion Week 2022, launched as a 3 day event, attracting 300,000 attendees and leading to a 70% conversion rate on digital items

6. **How can brands measure the success of a metaverse experience?**

   Brands can measure the success of a metaverse campaign by measuring key metrics like user participation, demographics, user engagement, revenue, conversion rates, user feedback, path tracking, and dwell time.

7. **What are the technical requirements for creating a metaverse experience?**

   Creating metaverse experiences requires various technical requirements, such as 3D modeling software, game engine programming, blockchain technology, artificial intelligence, platform integration, and networking.

8. **How can brands ensure the safety of users in the metaverse?**

   Brands should implement security measures for data encryption, fraud detection, and safe login procedures. A clear privacy policy should be outlined, and user consent to be obtained before collecting and using personal information. Brands should also monitor user-generated content and ensure it compiles with community guidelines.

9. **What are the best practices for engaging with the metaverse community?**

   A few ways brands can engage with the community in the metaverse is to communicate and update them with the help of social media channels, curate and optimize content, collaborate, leverage influencers, and provide value to the users

10. **How can brands stay ahead of the competition in the metaverse?**

    Brands can stay ahead of the competition by staying updated with metaverse developments, investing in innovative experiences, building a strong community, and being mindful of ethical and legal considerations.

# About LandVault

LandVault is the largest metaverse builder with over 100 million square feet of virtual real estate, more than 120 full-time creators, and nearly 300 completed projects. We've been helping brands build and grow in gaming environments since 2017 and the metaverse since 2021.

LandVault's platform-agnostic proprietary technology and creative powerhouse builds and delivers tailored, data-driven, and optimized business solutions and insights. We help clients launch, optimize, and monetize metaverse experiences.

LandVault's mission is to accelerate the metaverse economy through technology with a vision of a fairer wealth distribution across the web.
